- #define EMBER\_APPLICATION\_ERROR\_15(xFF)

### 8.82.1 Detailed Description

Return-code definitions for EmberZNet stack API functions. See [Status Codes](#) for documentation.

Definition in file [error-def.h](#).

#### 8.84.1 Macro Definition Documentation

##### 8.84.1.1 #define EMBER\_AF\_PLUGIN\_ESI\_MANAGEMENT\_ESI\_TABLE\_SIZE

Definition at line 11 of file [esi-management.h](#).

#### **8.84.1.2 #define EMBER\_AF\_PLUGIN\_ESI\_MANAGEMENT\_MIN\_ERASING\_AGE**

Definition at line 15 of file [esi-management.h](#).

#### **8.84.1.3 #define EMBER\_AF\_PLUGIN\_ESI\_MANAGEMENT\_PLUGIN\_CALLBACK\_TABLE\_SIZE**

Definition at line 19 of file [esi-management.h](#).

### **8.84.2 Typedef Documentation**

#### **8.84.2.1 typedef void(\* EmberAfEsiManagementDeletionCallback)(uint8\_t)**

Definition at line 30 of file [esi-management.h](#).

### **8.84.3 Function Documentation**

#### **8.84.3.1 EmberAfPluginEsiManagementEsiEntry\* emberAfPluginEsiManagementEsiLookUpByShortIdAndEndpoint ( EmberNodeId shortId, uint8\_t endpoint )**

It allows to search in the ESI table by the pair node (short id, endpoint).

It returns a pointer to the entry if a matching entry was found, otherwise it returns NULL.

#### **8.84.3.2 EmberAfPluginEsiManagementEsiEntry\* emberAfPluginEsiManagementEsiLookUpByLongIdAndEndpoint ( EmberEUI64 longId, uint8\_t endpoint )**

It allows to search in the ESI table by the pair node (long id, endpoint).

It returns a pointer to the entry if a matching entry was found, otherwise it returns NULL.

#### **8.84.3.3 uint8\_t emberAfPluginEsiManagementIndexLookUpByShortIdAndEndpoint ( EmberNodeId shortId, uint8\_t endpoint )**

It allows to retrieve the index of an entry that matches the passed short ID and endpoint.

It returns the index of the matching entry if a matching entry was found, otherwise it returns 0xFF.

#### **8.84.3.4 uint8\_t emberAfPluginEsiManagementIndexLookUpByLongIdAndEndpoint ( EmberEUI64 longId, uint8\_t endpoint )**

It allows to retrieve the index of an entry that matches the passed long ID and endpoint.

It returns the index of the matching entry if a matching entry was found, otherwise it returns 0xFF.

#### **8.84.3.5 EmberAfPluginEsiManagementEsiEntry\* emberAfPluginEsiManagementEsiLookUpByIndex ( uint8\_t index )**

It allows to search in the ESI table by the table index.

It returns a pointer to the ESI entry stored at the index passed as parameter.

**8.84.3.6 EmberAfPluginEsiManagementEsiEntry\* emberAfPluginEsiManagementGetNextEntry ( EmberAfPluginEsiManagementEsiEntry \* *entry*, uint8\_t *age* )**

This function can be used as an iterator to go through the entries in the table that are within a certain age threshold.

If the passed pointer is NULL, it returns the first active entry with age lesser or equal than the passed age parameter (if any). Otherwise it returns the next active entry that satisfy the age requirement. If there are no entries after the passed entry that satisfy the age requirement, it returns NULL.

**8.84.3.7 EmberAfPluginEsiManagementEsiEntry\* emberAfPluginEsiManagementGetFreeEntry ( void )**

This function allows to obtain a free entry in the ESI table. It is the requester responsibility to properly set all the fields in the obtained free entry such as nodeId, age, etc. in order to avoid inconsistencies in the table.

Returns a free entry (if any), otherwise it clears the oldest entry whose age is at least EMBER\_AF\_PLUGIN\_ESI\_MANAGEMENT\_MIN\_ERASING\_AGE (if any) and returns it, otherwise it returns NULL.

**8.84.3.8 void emberAfPluginEsiManagementDeleteEntry ( uint8\_t *index* )**

This function deletes the entry indicated by the parameter 'index' from the ESI table.

**8.84.3.9 void emberAfPluginEsiManagementAgeAllEntries ( void )**

This function increases the age of all the active entries in the table. A non-active entry is an entry whose short ID is set to EMBER\_NULL\_NODE\_ID.

**8.84.3.10 void emberAfPluginEsiManagementClearTable ( void )**

This function clears the ESI table, i.e., it sets the short ID of each entry to EMBER\_NULL\_NODE\_ID.

**8.84.3.11 bool emberAfPluginEsiManagementSubscribeToDeleteAnnouncements ( EmberAfEsiManagementDeletionCallback *callback* )**

This function allows a plugin to subscribe to ESI entries deletion announcements, by passing its own deletion callback function. Upon an entry deletion, all the deletion callback function are called passing the index of the deleted entry.

It returns true if the subscription was successful, false otherwise.

**8.84.3.12 uint8\_t emberAfPluginEsiManagementUpdateEsiAndGetIndex ( const EmberAfClusterCommand \* *cmd* )**

This function performs the following steps:

- Search for the source node of the passed command in the ESI table.
- Adds a new entry in the ESI table if the source node is not present in the ESI table yet, or updates the current entry if needed.

## Returns

The index of the source node of the passed command in the ESI table, or it returns 0xFF if the ESI was not present in the table and a new entry could not be added since the table was full.

#### 8.86.1 Macro Definition Documentation

##### 8.86.1.1 #define ZCL\_EVENTS\_INVALID\_INDEX

Definition at line 14 of file [events-server.h](#).

## 8.86.2 Function Documentation

### 8.86.2.1 bool emberAfEventsServerClearEventLog ( *uint8\_t endpoint*, EmberAfEventLogId *logId* )

Clear all events in the specified event log.

#### Parameters

<i>endpoint</i>	The endpoint for which the event log will be cleared.
<i>logId</i>	The log to be cleared

#### Returns

true if the log was successfully cleared or false if logId is invalid.

### 8.86.2.2 void emberAfEventsServerPrintEventLog ( *uint8\_t endpoint*, EmberAfEventLogId *logId* )

Print all events in the specified event log.

#### Parameters

<i>endpoint</i>	The endpoint for which the event log will be printed
<i>logId</i>	The log to be printed

### 8.86.2.3 void emberAfEventsServerPrintEvent ( const EmberAfEvent \* *event* )

Print an event.

#### Parameters

<i>event</i>	The event to print
--------------	--------------------

### 8.86.2.4 bool emberAfEventsServerGetEvent ( *uint8\_t endpoint*, EmberAfEventLogId *logId*, uint8\_t *index*, EmberAfEvent \* *event* )

Get an event from the specified event log.

This function can be used to get an event at a specific location in the specified log.

#### Parameters

<i>endpoint</i>	The relevant endpoint
<i>logId</i>	The relevant log
<i>index</i>	The index in the event log.
<i>event</i>	The <a href="#">EmberAfEvent</a> structure describing the event.

#### Returns

true if the event was found or false if the index is invalid.

### 8.86.2.5 bool emberAfEventsServerSetEvent ( uint8\_t *endpoint*, EmberAfEventLogId *logId*, uint8\_t *index*, const EmberAfEvent \* *event* )

Store an event in the specified event log.

This function can be used to set an event at a specific location in the specified log.

#### Parameters

<i>endpoint</i>	The relevant endpoint
<i>logId</i>	The relevant log
<i>index</i>	The index in the event log.
<i>event</i>	The <a href="#">EmberAfEvent</a> structure describing the event. If NULL, the event is removed from the server.

#### Returns

true if the event was set or removed or false if the index is invalid.

### 8.86.2.6 uint8\_t emberAfEventsServerAddEvent ( uint8\_t *endpoint*, EmberAfEventLogId *logId*, const EmberAfEvent \* *event* )

Add an event to the specified event log.

This function can be used to add an event at the next available location in the specified log. Once the event log is full, new events will start overwriting old events at the beginning of the table.

#### Parameters

<i>endpoint</i>	The relevant endpoint
<i>logId</i>	The relevant log
<i>event</i>	The <a href="#">EmberAfEvent</a> structure describing the event.

#### Returns

the index of the location in the log where the event was added or ZCL\_EVENTS\_INVALID\_INDEX if the specified event log is full.

### 8.86.2.7 void emberAfEventsServerPublishEventMessage ( EmberNodeId *nodeId*, uint8\_t *srcEndpoint*, uint8\_t *dstEndpoint*, EmberAfEventLogId *logId*, uint8\_t *index*, uint8\_t *eventControl* )

Publish an event.

This function will locate the event in the specified log at the specified location and using the information from the event build and send a PublishEvent command.

#### Parameters

<i>nodeId</i>	The destination nodeId
<i>srcEndpoint</i>	The source endpoint
<i>dstEndpoint</i>	The destination endpoint
<i>logId</i>	The relevant log
<i>index</i>	The index in the event log.

<i>eventControl</i>	Actions to be taken regarding this event. For example, Report event to HAN and/or Report event to WAN.
---------------------	--

- `EmberStatus emberAfEzmodeServerCommissionWithTimeout` (`uint8_t endpoint`, `uint16_t identifyTimeoutSeconds`)

#### 8.88.1 Enumeration Type Documentation

##### 8.88.1.1 enum `EmberAfEzModeCommissioningDirection`

Enumerator:

`EMBER_AF_EZMODE_COMMISSIONING_SERVER_TO_CLIENT`  
`EMBER_AF_EZMODE_COMMISSIONING_CLIENT_TO_SERVER`

Definition at line 3 of file `ez-mode.h`.

#### 8.88.2 Function Documentation

##### 8.88.2.1 `EmberStatus emberAfEzmodeClientCommission` ( `uint8_t endpoint`, `EmberAfEzModeCommissioningDirection direction`, `const uint16_t * clusterIds`, `uint8_t clusterIdsLength` )

Starts EZ-Mode Client commissioning.

Kicks off the ezmode commissioning process by sending out an identify query command to the given endpoint. Endpoints that return an identify query response are interrogated for the given cluster ids in the given direction (client or server).

#### Parameters

<code>endpoint</code>	The endpoint to send the identify query command from
<code>direction</code>	The side of the cluster ids given either client or server
<code>clusterIds</code>	An array of clusters against which to match. <i>NOTE</i> The API only keeps the pointer to the data structure. The data is expected to exist throughout the ezmode-commissioning calls.
<code>clusterIdsLength</code>	The number of cluster ids passed for the match

### 8.88.2.2 EmberStatus emberAfEzmodeServerCommission ( *uint8\_t endpoint* )

Begins EZ-Mode server commissioning.

Kicks off the server side of EZ-Mode commissioning by putting the device into identify mode.

#### Parameters

<i>endpoint</i>	The endpoint on which to begin identifying
-----------------	--

### 8.88.2.3 EmberStatus emberAfEzmodeServerCommissionWithTimeout ( *uint8\_t endpoint, uint16\_t identifyTimeoutSeconds* )

Begins EZ-Mode server commissioning with a given timeout.

Kicks off the server side of EZ-Mode commissioning by putting the device into identify mode for a given time.

#### Parameters

<i>endpoint</i>	The endpoint on which to begin identifying
<i>identify- Timeout- Seconds</i>	The number of seconds to identify for before stopping identify mode.

## 8.92.2 Function Documentation

### 8.92.2.1 EmberStatus emberAfPluginFindAndBindInitiatorStart ( uint8\_t endpoint )

Start initiator finding and binding operations.

A call to this function will commence the initiator finding and binding operations. Specifically, the initiator will attempt to start searching for potential bindings that can be made with identifying targets.

#### Parameters

<i>endpoint</i>	The endpoint on which to begin initiator operations.
-----------------	--

#### Returns

An [EmberStatus](#) value describing the success of the commencement of the initiator operations.

### 8.104.1 Macro Definition Documentation

#### 8.104.1.1 #define `emberAfPluginGbcDeviceLogPrint`( ... )

Definition at line 12 of file `gbcs-device-log.h`.

#### 8.104.1.2 #define `emberAfPluginGbcDeviceLogPrintln`( ... )

Definition at line 13 of file `gbcs-device-log.h`.

#### 8.104.1.3 #define `emberAfPluginGbcDeviceLogDebugExec`( x )

Definition at line 14 of file `gbcs-device-log.h`.

#### 8.104.1.4 #define `emberAfPluginGbcDeviceLogIsSleepyType`( *deviceType* )

Is the given device type a sleepy device.

##### Parameters

<i>deviceType</i>	The GBCS device type to be checked.
-------------------	-------------------------------------

##### Returns

true if the *deviceType* is a sleepy device, false otherwise

Definition at line 115 of file `gbcs-device-log.h`.

### 8.104.2 Enumeration Type Documentation

#### 8.104.2.1 enum `EmberAfGBCSDeviceType`

Enumerator:

*EMBER\_AF\_GBCS\_GSME\_DEVICE\_TYPE*  
*EMBER\_AF\_GBCS\_ESME\_DEVICE\_TYPE*  
*EMBER\_AF\_GBCS\_CHF\_DEVICE\_TYPE*  
*EMBER\_AF\_GBCS\_GPF\_DEVICE\_TYPE*  
*EMBER\_AF\_GBCS\_HCALCS\_DEVICE\_TYPE*  
*EMBER\_AF\_GBCS\_PPMID\_DEVICE\_TYPE*  
*EMBER\_AF\_GBCS\_TYPE2\_DEVICE\_TYPE*

Definition at line 16 of file `gbcs-device-log.h`.

### 8.104.3 Function Documentation

#### 8.104.3.1 void emberAfPluginGbcDeviceLogClear ( void )

Clear all entries from the GBCS Device Log.

#### 8.104.3.2 void emberAfPluginGbcDeviceLogReset ( void )

Reset the GBCS Device Log to include just those entries configured with the plugin.

This function will clear the device log then add each of the devices configured with the plugin.

#### 8.104.3.3 uint8\_t emberAfPluginGbcDeviceLogCount ( void )

Get the number of entries in the GBCS Device Log.

##### Returns

The number of entries currently in the GBCS Device Log..

#### 8.104.3.4 bool emberAfPluginGbcDeviceLogStore ( EmberEUI64 deviceId, EmberAfGBCSDeviceInfo \* deviceInfo )

Add or update an entry within the GBCS Device Log.

This function can be used to add or update an entry within the GBCS Device Log.

##### Parameters

<i>deviceId</i>	The EUI64 of the device to be added or updated.
<i>deviceInfo</i>	Pointer to a structure containing the deviceType of the device to be added or updated.

##### Returns

true if successfully added or updated, false if there is insufficient room in the device log to add the new entry. The size of the device log is controlled by the "Device Log Size" plugin configuration parameter.

#### 8.104.3.5 bool emberAfPluginGbcDeviceLogRemove ( EmberEUI64 deviceId )

Remove an entry from the GBCS Device Log.

This function can be used to remove an entry within the GBCS Device Log.

##### Parameters

<i>deviceId</i>	The EUI64 of the device to be removed.
-----------------	--

##### Returns

true if successfully removed, false if the device is not currently in the GBCS Device Log.

#### 8.104.3.6 bool emberAfPluginGbcDeviceLogGet ( EmberEUI64 deviceId, EmberAfGBCSDeviceLogInfo \* deviceInfo )

Get device info about an entry in the GBCS Device Log.

This function can be used to retrieve information pertaining to a device in the GBCS Device Log. Note that if a single device implements two device types (i.e comms hub implements both the CHF and GPF) then only the first device found is returned.

##### Parameters

<i>deviceId</i>	The EUI64 of the device for which information is requested.
-----------------	---

##### Returns

true if device is in the device log, false otherwise. The contents of the deviceInfo structure will be populated when true is returned.

#### 8.104.3.7 bool emberAfPluginGbcDeviceLogExists ( EmberEUI64 deviceId, EmberAfGBCSDeviceType deviceType )

Check to see if the given device exists within the GBCS Device Log.

This function can be used to check if the given device and type exists within the GBCS Device Log..

##### Parameters

<i>deviceId</i>	The EUI64 of the device in question
<i>deviceType</i>	The device type of the device in question.

##### Returns

true if device is in the device log, false otherwise.

#### 8.104.3.8 void emberAfPluginGbcDeviceLogPrintEntries ( void )

Print all entries in the GBCS Device log.

#### 8.104.3.9 bool emberAfPluginGbcDeviceLogRetrieveByIndex ( uint8\_t index, EmberEUI64 returnDeviceId, EmberAfGBCSDeviceLogInfo \* returnDeviceInfo )

Retrieves the device from the log at the specified index.

##### Parameters

<i>index</i>	The absolute index into the device log.
<i>returnDeviceId</i>	a pointer where the EUI64 return data will be written.
<i>returnDevice- Info</i>	a pointer where the device info return data will be written.

## Returns

true if the index has a valid entry. false otherwise.

#### 8.104.3.10 uint8\_t emberAfPluginGbcsDeviceLogMaxSize ( void )

@ brief Returns the max size of the device log, including currently empty entries.

## Returns

an `uint8_t` indicating the maximum size.

## 8.105 gucs-device-log.h

```

00115 #define emberAfPluginGbcDeviceLogIsSleepyType(deviceType) (deviceType ==
00116     EMBER_AF_GBCS_GSME_DEVICE_TYPE)

### 8.106.2 Function Documentation

#### 8.106.2.1 void `emberAfPluginGbcGasMeterReportAttributes ( void )`

Report Attributes.

If the mirror is ready to receive attribute reports and there is not already a report in progress the this function will kick off the task of reporting all attributes to the mirror.

## 8.108.3 Enumeration Type Documentation

8.108.3.1 enum GBCSUseCaseMessageCode

Enumerator:

- GCS06\_MESSAGE\_CODE*
- GCS11\_MESSAGE\_CODE*
- CS11\_MESSAGE\_CODE*
- GCS01a\_MESSAGE\_CODE*
- GCS01b\_MESSAGE\_CODE*
- GCS05\_MESSAGE\_CODE*
- GCS07\_MESSAGE\_CODE*
- GCS09\_MESSAGE\_CODE*
- GCS13a\_MESSAGE\_CODE*

```

GCS13b_MESSAGE_CODE
GCS13c_MESSAGE_CODE
GCS14_MESSAGE_CODE
GCS17_MESSAGE_CODE
GCS21d_MESSAGE_CODE
GCS21e_MESSAGE_CODE
GCS21j_MESSAGE_CODE
GCS23_MESSAGE_CODE
GCS25_MESSAGE_CODE
GCS33_MESSAGE_CODE
GCS38_MESSAGE_CODE
GCS44_MESSAGE_CODE
GCS46_MESSAGE_CODE
GCS60_MESSAGE_CODE
CS10a_MESSAGE_CODE
CS10b_MESSAGE_CODE
GCS61_MESSAGE_CODE
GCS16a_MESSAGE_CODE
GCS16b_MESSAGE_CODE
GCS15b_MESSAGE_CODE
GCS15c_MESSAGE_CODE
GCS15d_MESSAGE_CODE
GCS15e_MESSAGE_CODE
GCS21f_MESSAGE_CODE
GCS21b_MESSAGE_CODE
GCS53_MESSAGE_CODE
TEST_ENCRYPTED_MESSAGE_CODE
TEST_MESSAGE_CODE

```

Definition at line 11 of file [gbz-message-controller.h](#).

#### 8.108.3.2 enum EmberAfGbzExtendedHeaderControlField

Enumerator:

```

EMBER_AF_GBZ_NOT_LAST_UNENCRYPTED_MESSAGE
EMBER_AF_GBZ_LAST_UNENCRYPTED_MESSAGE
EMBER_AF_GBZ_NOT_LAST_ENCRYPTED_MESSAGE
EMBER_AF_GBZ_LAST_ENCRYPTED_MESSAGE

```

Definition at line 81 of file [gbz-message-controller.h](#).

### 8.108.3.3 enum EmberAfGbzMessagetype

Enumerator:

*EMBER\_AF\_GBZ\_MESSAGE\_COMMAND*  
*EMBER\_AF\_GBZ\_MESSAGE\_RESPONSE*  
*EMBER\_AF\_GBZ\_MESSAGE\_ALERT*

Definition at line 88 of file [gbz-message-controller.h](#).

### 8.108.4 Function Documentation

- 8.108.4.1 `EmberAfStatus emberAfClusterSpecificCommandParse ( EmberAfClusterCommand * cmd )`

- `bool emberAflasZoneClusterAmIEnrolled (uint8_t endpoint)`

### 8.126.1 Macro Definition Documentation

#### 8.126.1.1 `#define EM_AF_UNKNOWN_ENDPOINT`

Definition at line 15 of file [ias-zone-server.h](#).

### 8.126.2 Function Documentation

#### 8.126.2.1 `EmberStatus emberAfPluginIasZoneServerUpdateZoneStatus ( uint8_t endpoint, uint16_t newStatus, uint8_t timeSinceStatusOccurredQs )`

Update the zone status for an endpoint.

This function will update the zone status attribute of the specified endpoint using the specified new zone status. It will then notify the CIE of the updated status.

#### Parameters

<code>endpoint</code>	The endpoint whose zone status attribute is to be updated
<code>newStatus</code>	The new status to write to the attribute

<i>timeSince-Status-OccurredQs</i>	The amount of time (in quarter seconds) that has passed since the status change occurred
------------------------------------	--

**Returns**

EMBER\_SUCCESS if the attribute update and notify succeeded, error code otherwise

**8.126.2.2 uint8\_t emberAfPluginIasZoneServerGetZoneId ( uint8\_t endpoint )**

Get the CIE assigned zone id of a given endpoint.

This function will return the zone ID that was assigned to the given endpoint by the CIE at time of enrollment.

**Parameters**

<i>endpoint</i>	The endpoint whose ID is to be queried
-----------------	--

**Returns**

The zone ID assigned by the CIE at time of enrollment

**8.126.2.3 bool emberAfIasZoneClusterAmIEnrolled ( uint8\_t endpoint )**

Determine the enrollment status of a given endpoint.

This function will return true or false depending on whether the specified endpoint has undergone IAS Zone Enrollment.

**Parameters**

<i>endpoint</i>	The endpoint whose enrollment status is to be queried
-----------------	---

**Returns**

true if enrolled, false otherwise

**8.127 ias-zone-server.h**

### 8.132.2 Function Documentation

#### 8.132.2.1 void emberAfPluginIlluminanceMeasurementServerSetMeasurementRate ( uint32\_t measurementRateS )

Set the hardware read interval.

This function will set the amount of time to wait (in seconds) between polls of the illuminance sensor. This function will never set the measurement interval to be greater than the plugin specified maximum measurement interval. If a value of 0 is given, the plugin specified maximum measurement interval will be used for the polling interval.

### 8.150.3 Function Documentation

#### 8.150.3.1 void afLoadControlEventTableInit ( uint8\_t endpoint )

#### 8.150.3.2 void emAfScheduleLoadControlEvent ( uint8\_t endpoint, EmberAfLoadControlEvent \* event )

This function is used to schedule events in the load control event table. The interface expects that the user will populate a LoadControlEvent with all the necessary fields and will pass a pointer to this event. The passed event will be copied into the event table so it does not need to survive the call to scheduleEvent.

A call to this function always generates an event response OTA

### **8.150.3.3 void emAfLoadControlEventTableTick ( uint8\_t endpoint )**

Tells the Event table when a tick has taken place. This function should be called by the cluster that uses the event table.

### **8.150.3.4 bool emAfCancelAllLoadControlEvents ( uint8\_t endpoint, uint8\_t cancelControl )**

Used to cancel all events in the event table

#### **Returns**

A bool value indicating that a response was generated for this action.

### **8.150.3.5 void emAfCancelLoadControlEvent ( uint8\_t endpoint, uint32\_t eventId, uint8\_t cancelControl, uint32\_t effectiveTime )**

Used to cancel an event in the event table

A call to this function always generates an event response OTA.

### **8.150.3.6 void afScheduleCancelEvent ( EmberAfLoadControlEvent \* e )**

Used to schedule a call to cancel an event. Takes a LoadControlEvent struct which is used to encapsulate the necessary information for the scheduled cancel.

The scheduleCancelEvent function only uses three fields from the LoadControlEvent struct, eventId, startTime, and eventControl, as follows:

eventId: The eventId of the event to cancel.

startTime: The starttime of the event should be the same as the effective time of the cancel and will be used to schedule the call to cancel.

eventControl: The eventControl of the event should be the same as the cancelControl passed when sending the initial cancel event call.

NOTE: A call to cancelAllEvents() will wipe out this scheduled cancel as well as all other events which should be ok, since the event scheduled to cancel would be affected as well by the cancel all call anyway.

### **8.150.3.7 void emAfLoadControlEventOptInOrOut ( uint8\_t endpoint, uint32\_t eventId, bool optIn )**

An interface for opting in and out of an event

### **8.150.3.8 void emberAfEventAction ( EmberAfLoadControlEvent \* event, uint8\_t eventStatus, uint8\_t sequenceNumber, uint8\_t esilIndex )**

Called by the event table when an events status has changed. This handle should be used to inform the ESP(s) and or react to scheduled events. The event table will take care of clearing itself if the event is completed.

### 8.150.3.9 void emAfNoteSignatureFailure ( void )

A routine that prints a message indicating an attempt to append a signature to the event status message has failed.

### 8.150.3.10 void emAfLoadControlEventTablePrint ( uint8\_t endpoint )

Prints the load control event table

### 8.150.3.11 void emAfLoadControlEventTableInit ( uint8\_t endpoint )

Initialization function.

### 8.150.3.12 void emAfLoadControlEventTableClear ( uint8\_t endpoint )

## 8.151 load-control-event-table.h

```

00001 // ****
00002 // * load-control-event-table.h
00003 // *
00004 // * The Demand Response Load Control Event Table is responsible
00005 // * for keeping track of all load control events scheduled
00006 // * by the Energy Service Provider. This module provides
00007 // * interfaces used to schedule and inform load shedding
00008 // * devices of scheduled events.
00009 // *
00010 // * Any code that uses this event table is responsible for
00011 // * providing four things:
00012 // *   1. frequent calls to eventTableTick(), one per millisecond
00013 // *      will do. These calls are used to drive the
00014 // *      table's timing mechanism.
00015 // *   2. A way to get the real time by implementing
00016 // *      getCurrentTime(uint32_t *currentTime);
00017 // *   3. An implementation of eventAction which
00018 // *      will be called whenever event status changes
00019 // *
00020 // * The load control event table expects that currentTime, startTime
00021 // * and randomization are provided in seconds. And that duration is
00022 // * provided in minutes.
00023 // *
00024 // * The implementing code is responsible for over the
00025 // * air communication based on event status changes
00026 // * reported through the eventAction interface
00027 // *
00028 // * Copyright 2007 by Ember Corporation. All rights reserved.

## 8.154 manufacturing-library-cli-plugin.h File Reference

### Functions

- `bool emberAfMfglibRunning (void)`
- `bool emberAfMfglibEnabled (void)`

### 8.154.1 Function Documentation

#### 8.154.1.1 `bool emberAfMfglibRunning ( void )`

Returns a true if the manufacturing library is currently running.

Function to return whether the manufacturing library is currently running. Code that initiates scan/join behavoir should not do so if the manufacturing library is currently running as this will cause a conflict and may result in a fatal error.

#### Returns

A ::bool value that is true if the manufacturing library is running, and false if it is not.

#### 8.154.1.2 `bool emberAfMfglibEnabled ( void )`

Returns a true if the manufacturing library token has been set.

Function to return whether the manufacturing library token has currently been set. Reference designs are programmed to initiate off scan/join behavoir as soon as the device has been powered up. Certain sleepy devices, such as security sensors, may also use the UART for manufacturing, which becomes inactive during normal operation. Setting this token will allow the device to stay awake or hold off on normal joining behavior for a few seconds to allow manufacturing mode to be enabled. The last step in the manufacturing process would be to disable this token.

Note: this token is disabled by default. If you wish to enable it by default in your application, you must edit the file `app/framework/plugin/mfg-lib/mfg-lib-tokens.h`.

## Returns

A ::bool value that is true if the manufacturing library token has been set and false if it has not been set.

## 8.158.2 Function Documentation

### 8.158.2.1 void emAfPluginMessagingClientClearMessage ( uint8\_t *endpoint* )

Clear the message.

This function can be used to manually deactivate or clear the message.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
-----------------	------------------------

### 8.158.2.2 void emAfPluginMessagingClientPrintInfo ( uint8\_t *endpoint* )

Prints information about the message.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
-----------------	------------------------

### 8.158.2.3 EmberAfStatus emberAfPluginMessagingClientConfirmMessage ( uint8\_t *endpoint* )

Confirm a message.

This function can be used to confirm a message. The Messaging client plugin will send the confirmation command to the endpoint on the node that sent the message.

#### Returns

[EMBER\\_ZCL\\_STATUS\\_SUCCESS](#) if the confirmation was sent, [EMBER\\_ZCL\\_STATUS\\_FAILURE](#) if an error occurred, or [EMBER\\_ZCL\\_STATUS\\_NOT\\_FOUND](#) if the message does not exist.

## 8.160.2 Function Documentation

### 8.160.2.1 bool emberAfPluginMessagingServerGetMessage ( uint8\_t endpoint, EmberAfPluginMessagingServerMessage \* message )

Get the message used by the Messaging server plugin.

This function can be used to get the message and metadata that the plugin will send to clients. For "start now" messages that are current or scheduled, the duration is adjusted to reflect how many minutes remain for the message. Otherwise, the start time and duration of "start now" messages reflect the actual start and the original duration.

#### Parameters

<i>endpoint</i>	The relevant endpoint
<i>message</i>	The <a href="#">EmberAfPluginMessagingServerMessage</a> structure describing the message.

#### Returns

true if the message is valid or false if the message does not exist or is expired.

### 8.160.2.2 void emberAfPluginMessagingServerSetMessage ( uint8\_t endpoint, const EmberAfPluginMessagingServerMessage \* message )

Set the message used by the Messaging server plugin.

This function can be used to set the message and metadata that the plugin will send to clients. Setting the start time to zero instructs clients to start the message now. For "start now" messages, the plugin will automatically adjust the duration reported to clients based on the original start time of the message.

#### Parameters

<i>endpoint</i>	The relevant endpoint
<i>message</i>	The <a href="#">EmberAfPluginMessagingServerMessage</a> structure describing the message. If NULL, the message is removed from the server.

**8.160.2.3 void emAfPluginMessagingServerPrintInfo ( uint8\_t *endpoint* )**

**8.160.2.4 void emberAfPluginMessagingServerDisplayMessage ( EmberNodeId *nodeId*, uint8\_t *srcEndpoint*, uint8\_t *dstEndpoint* )**

**8.160.2.5 void emberAfPluginMessagingServerCancelMessage ( EmberNodeId *nodeId*, uint8\_t *srcEndpoint*, uint8\_t *dstEndpoint* )**

- `EmberStatus emberAfPluginNetworkCreatorSecurityCloseNetwork (void)`

#### 8.172.1 Macro Definition Documentation

##### 8.172.1.1 `#define EMBER_AF_PLUGIN_NETWORK_CREATOR_SECURITY_PLUGIN_NAME`

Definition at line 6 of file [network-creator-security.h](#).

#### 8.172.2 Function Documentation

##### 8.172.2.1 `EmberStatus emberAfPluginNetworkCreatorSecurityStart ( bool centralizedNetwork )`

Start.

This API initializes the security needed for forming and then operating on a network. The centralized-Network parameter allows the caller to specify whether or not the network that they plan to form will use centralized or distributed security.

**Parameters**

<i>centralized-Network</i>	Whether or not the network that the caller plans to form will use centralized or distributed security.
----------------------------	--

**Returns**

Status of the commencement of the network creator process.

**8.172.2.2 EmberStatus emberAfPluginNetworkCreatorSecurityOpenNetwork ( void )**

Open Network.

This API will open a network for joining. It broadcasts a permit join to the network, as well as adds a transient link key of ZigBeeAlliance09 if this device is a trust center.

**Returns**

An [EmberStatus](#) value describing the success or failure of the network opening procedure. If this node is not currently on a network, then this will return [EMBER\\_ERR\\_FATAL](#).

**8.172.2.3 EmberStatus emberAfPluginNetworkCreatorSecurityCloseNetwork ( void )**

Close Network.

This API will close the network for joining. It broadcasts a permit join to the network with time 0, as well as clears any transient link keys in the stack.

**Returns**

An [EmberStatus](#) value describing closing the network. If this node is not currently on a network, then this will return [EMBER\\_ERR\\_FATAL](#). This API will also return an error code based on the success or failure of the broadcasted permit join.

#### 8.174.2 Function Documentation

##### 8.174.2.1 `EmberStatus emberAfPluginNetworkCreatorStart ( bool centralizedNetwork )`

Start.

Commands the network creator to form a network with the following qualities.

#### Parameters

<code>centralized-Network</code>	Whether or not to form a network usingn centralized security. If this argument is false, then a network with distributed security will be formed.
----------------------------------	---

#### Returns

Status of the commencement of the network creator process.

##### 8.174.2.2 `void emberAfPluginNetworkCreatorStop ( void )`

Stop.

Stops the network creator formation process.

### 8.178.3 Function Documentation

#### 8.178.3.1 EmberStatus `emberAfPluginNetworkSteeringStart( void )`

Start.

Initiate a network-steering procedure.

If the node is currently on a network, it will perform network steering for node on a network, in which it opens up the network with a broadcasted permit join message.

If the node is not on a network, it will scan a series of primary channels (see [emAfPluginNetworkSteeringPrimaryChannelMask](#)) to try to find possible networks to join. If it is unable to join any of those networks, it will try scanning on a set of secondary channels (see [emAfPluginNetworkSteeringSecondaryChannelMask](#)). Upon completion of this process, the plugin will call [emberAfPluginNetworkSteeringCompleteCallback](#) with information regarding the success or failure of the procedure.

This procedure will try to join networks using install codes, the centralized default key, and the distributed default key.

#### Returns

An [EmberStatus](#) value that indicates the success or failure of the initiating of the network steering process.

#### 8.178.3.2 EmberStatus `emberAfPluginNetworkSteeringStop( void )`

Stop.

Stop the network steering procedure.

#### Returns

An [EmberStatus](#) value that indicates the success or failure of the initiating of the network steering process.

### 8.178.4 Variable Documentation

#### 8.178.4.1 PGM `uint8_t emAfNetworkSteeringPluginName[ ]`

#### 8.178.4.2 EmberAfPluginNetworkSteeringOptions `emAfPluginNetworkSteeringOptionsMask`

#### 8.178.4.3 uint32\_t `emAfPluginNetworkSteeringPrimaryChannelMask`

The first set of channels on which to search for joinable networks.

#### 8.178.4.4 uint32\_t `emAfPluginNetworkSteeringSecondaryChannelMask`

The second set of channels on which to search for joinable networks.

```

0001 // Layout of the EEPROM data for OTA is dependent upon whether SOC Bootloading
      support is
0002 // enabled. When it is NOT enabled, the layout of data is pretty
0003 // straightforward:
0004
0005 // LAYOUT 1
0006 //
0007 // EEPROM Start          -----
0008 // Image Info Meta-data |   Info   |
0009 //                      -----
0010 // OTA Header (offset 0 for the |   OTA   |
0011 //           OTA storage module) |   Header  |
0012 //                                -----
0013 // Rest of OTA image          |         |

```

```

00014 // (upgrade image data)           |   EBL    |
00015 //                                |   +     |
00016 //                                | Signature |
00017 // End of OTA image              -----
00018 //
00019 // ... (unused) ...
00020 //
00021 // EEPROM End                  -----
00022
00023
00024 // For SOC Bootloading, we must put the EBL at the top of the EEPROM
00025 // since existing bootloaders have no knowledge of OTA headers.
00026
00027 // LAYOUT 2
00028 //
00029 // EEPROM Start                -----
00030 // Beginning of EBL file       |   EBL    |
00031 // (upgrade image data)       |   +     |
00032 //
00033 // End of EBL data            |
00034 //
00035 // Other OTA image data      |   Signature |
00036 // (e.g. signature)          |
00037 //
00038 // End of OTA image          -----
00039 //
00040 // ... (unused) ...
00041 //
00042 //
00043 // Image Info Meta-data     |   Info   |
00044 //
00045 // OTA Header (offset 0 for the |   OTA    |
00046 //             OTA storage module) |   Header  |
00047 // ...extra space...
00048 // EEPROM End                 -----
00049
00050
00051 // The Image Info Meta-data is DIFFERENT than previous versions of this plugin.
00052 // The meta-data NOW contains the following data:
00053 //   Ember Magic Number (8 bytes)
00054 //     [different than the OTA file magic number]
00055 //   Version Tag (2 bytes)
00056 //   EBL Start offset within OTA file (4 bytes)
00057 //   Saved Download Offset data (100 bytes)
00058 //     This comes in 2 flavors:
00059 //       1. For read-modify-write flash drivers this will be a simple 4-byte
00060 //           counter indicating the last downloaded offset. It will only be
00061 //           updated
00062 //           based on the plugin option...
00063 //           EMBER_AF_PLUGIN_OTA_STORAGE_SIMPLE_EEPROM_DOWNLOAD_OFFSET_SAVE_RATE
00064 //           Rest of the space is unused.
00065 //     2. For flash drivers without read-modify-write support, we will use
00066 //         a byte-mask indicating the last full flash page of written data.
00067 //         The byte-mask will have negative logic (0xFF means flash page not
00068 //         downloaded) and requires one byte per page of the EEPROM space
00069 //         allocated for the OTA code.
00070 //         In other words if the client is given 200k of download space within
00071 //         the EEPROM, and a flash page is 4k, then we need 50 bytes for the
00072 //         byte-mask.

### 8.228.1 Enumeration Type Documentation

#### 8.228.1.1 anonymous enum

Enumerator:

*DEBT\_TYPE\_1*  
*DEBT\_TYPE\_2*  
*DEBT\_TYPE\_3*  
*DEBT\_TYPE\_ALL*

Definition at line 23 of file [prepayment-debt-log.h](#).

### 8.228.2 Function Documentation

#### 8.228.2.1 void `emberAfPluginPrepaymentServerInitDebtLog` ( void )

Initialize the debt log.

#### 8.228.2.2 void `emberAfPluginUpdateDebtOnCollectionEvent` ( uint8\_t *endpoint*, uint8\_t *debtType* )

Updates the debt collection attributes for the specified debt index (DEBT\_INDEX\_1, 2, or 3).

##### Parameters

<i>endpoint</i>	The endpoint number of the prepayment server.
<i>debtIndex</i>	The debt index whose collection attributes should be updated

#### 8.228.2.3 void `emberAfPluginPrepaymentPrintDebtLogIndex` ( uint8\_t *index* )

Print the information in the debt log at the specified index.

##### Parameters

<i>index</i>	The index into the debt log whose contents should be printed.
--------------	---

#### 8.228.2.4 void emberAfPluginPrepaymentPrintDebtAttributes ( uint8\_t *endpoint*, uint8\_t *index* )

Print the debt attribute set specified by the index parameter.

##### Parameters

<i>endpoint</i>	The endpoint number of the prepayment server.
<i>index</i>	Specifies which of the 3 debt attribute sets should be printed.

#### 8.228.2.5 void emberAfPluginSendPublishDebtLog ( EmberNodeId *nodeId*, uint8\_t *srcEndpoint*, uint8\_t *dstEndpoint*, uint32\_t *latestEndTime*, uint8\_t *numberOfDebts*, uint8\_t *debtType* )

Called to request sending a Publish Debt Log command.

##### Parameters

<i>nodeId</i>	The address of the destination node to whom the Publish Debt Log command should be sent.
<i>srcEndpoint</i>	The endpoint of the sender that supports the prepayment server.
<i>dstEndpoint</i>	The endpoint on the destination node that supports the prepayment client.
<i>latestEndTime</i>	The latest collection time of debt repayment records to be returned in the Publish Debt Log command.
<i>numberOfDebts</i>	The maximum number of debt repayment records to send in the command.
<i>debtType</i>	Identifies the type of debt record(s) to include in the command.

#### 8.228.2.6 uint32\_t emberAfPluginPrepaymentGetDebtRecoveryTopUpPercentage ( uint8\_t *endpoint*, uint32\_t *topUpValue* )

Calculates the percentage of a top up amount that should be applied towards debt reduction.

##### Parameters

<i>endpoint</i>	The endpoint number of the prepayment server
<i>topUpValue</i>	The top up value amount.

##### Returns

Returns the amount of the top up value that should be applied to debt reduction.

## 8.230 prepayment-debt-schedule.h File Reference

### Data Structures

- struct [emDebtScheduleEntry](#)

### Functions

- void [emberAfPluginPrepaymentServerInitDebtSchedule](#) (void)
- void [emberAfPluginPrepaymentServerScheduleDebtRepayment](#) (uint8\_t endpoint, uint32\_t issuerEventId, uint8\_t debtType, uint16\_t collectionTime, uint32\_t startTime, uint8\_t collectionFrequency)
- void [emberAfPrepaymentServerSetDebtMode](#) (uint8\_t endpoint, uint32\_t timeNowUtc)
- uint32\_t [emberAfPrepaymentServerSecondsUntilDebtCollectionEvent](#) (uint32\_t timeNowUtc)

#### 8.230.1 Function Documentation

##### 8.230.1.1 void [emberAfPluginPrepaymentServerInitDebtSchedule](#) ( void )

Initializes the debt schedule.

**8.230.1.2 void emberAfPluginPrepaymentServerScheduleDebtRepayment ( uint8\_t endpoint, uint32\_t issuerEventId, uint8\_t debtType, uint16\_t collectionTime, uint32\_t startTime, uint8\_t collectionFrequency )**

Schedules a received debt repayment event.

#### Parameters

<i>endpoint</i>	The endpoint number of the prepayment server.
<i>issuerEventId</i>	The issuerEventId sent in the received Change Debt command.
<i>debtType</i>	Indicates if the debt applies to Debt #1, #2, or #3 attributes.
<i>collectionTime</i>	The time offset (in minutes) relative to midnight when debt collection should take place.
<i>startTime</i>	The UTC time that denotes the time at which the debt collection should start, subject to the collectionTime.
<i>collectionFrequency</i>	Specifies the period over which each collection should take place (hourly, daily, weekly, etc).

**8.230.1.3 void emberAfPrepaymentServerSetDebtMode ( uint8\_t endpoint, uint32\_t timeNowUtc )**

Checks all debt schedules to see if any debt collections must be performed.

#### Parameters

<i>endpoint</i>	The endpoint number of the prepayment server.
<i>timeNowUtc</i>	Specifies the current UTC time.

**8.230.1.4 uint32\_t emberAfPrepaymentServerSecondsUntilDebtCollectionEvent ( uint32\_t timeNowUtc )**

Determines the number of seconds until the next debt collection event will occur.

#### Parameters

<i>timeNowUtc</i>	Specifies the current UTC time.
-------------------	---------------------------------

## 8.232 prepayment-modes-table.h File Reference

### Functions

- void [emInitPrepaymentModesTable](#) (void)
- void [emberAfPrepaymentSchedulePrepaymentMode](#) (uint8\_t endpoint, uint32\_t providerId, uint32\_t issuerEventId, uint32\_t dateUTC, uint16\_t paymentControlConfig)
- uint32\_t [emberAfPrepaymentServerSecondsUntilPaymentModeEvent](#) (uint32\_t timeNowUTC)
- void [emberAfPrepaymentServerSetPaymentMode](#) (uint8\_t endpoint)

#### 8.232.1 Function Documentation

##### 8.232.1.1 void emInitPrepaymentModesTable ( void )

Initializes the prepayment mode table.

##### 8.232.1.2 void emberAfPrepaymentSchedulePrepaymentMode ( uint8\_t endpoint, uint32\_t providerId, uint32\_t issuerEventId, uint32\_t dateUTC, uint16\_t paymentControlConfig )

Schedules a prepayment mode at some current or future time.

#### Parameters

<i>endpoint</i>	The endpoint of the device that supports the prepayment server.
<i>providerId</i>	A unique identifier for the commodity supplier to whom this command relates.
<i>issuerEventId</i>	A unique identifier that identifies this prepayment mode event. Newer events should have a larger issuerEventId than older events.
<i>dateUTC</i>	The UTC time that indicates when the payment mode change should be applied. A value of 0x00000000 indicates the command should be executed immediately. A value of 0xFFFFFFFF indicates an existing change payment mode command with the same provider ID and issuer event ID should be cancelled.
<i>paymentControlConfig</i>	A bitmap that indicates which actions should be taken when switching the payment mode.

### 8.232.1.3 `uint32_t emberAfPrepaymentServerSecondsUntilPaymentModeEvent ( uint32_t timeNowUtc )`

Determines the number of remaining seconds until the next prepayment mode event is scheduled to occur.

#### Parameters

<code>timeNowUtc</code>	The current UTC time.
-------------------------	-----------------------

#### Returns

Returns the number of remaining seconds until the next prepayment mode event.

### 8.232.1.4 `void emberAfPrepaymentServerSetPaymentMode ( uint8_t endpoint )`

Sets the current payment mode on the prepayment server.

#### Parameters

<code>endpoint</code>	The endpoint of the prepayment server.
-----------------------	--

#### 8.234.2 Enumeration Type Documentation

##### 8.234.2.1 anonymous enum

Enumerator:

##### `SNAPSHOT_PAYLOAD_TYPE_DEBT_OR_CREDIT_STATUS`

Definition at line 6 of file `prepayment-server.h`.

#### 8.234.3 Function Documentation

##### 8.234.3.1 `void emberAfPluginPrepaymentServerPublishPrepaySnapshot ( EmberNodeId nodeId, uint8_t srcEndpoint, uint8_t dstEndpoint, uint32_t snapshotId, uint32_t snapshotTime, uint8_t totalSnapshotsFound, uint8_t commandIndex, uint8_t totalNumberOfCommands, uint32_t snapshotCause, uint8_t snapshotPayloadType, uint8_t * snapshotPayload )`

Sends a Publish Prepay Snapshot command, sent in response to the Get Prepay Snapshot command..

**Parameters**

<i>nodeId</i>	The short address of the destination device.
<i>srcEndpoint</i>	The source endpoint used in the ZigBee transmission.
<i>dstEndpoint</i>	The destination endpoint used in the ZigBee transmission.
<i>snapshotId</i>	A unique identifier allocated by the device that created the snapshot.
<i>snapshotTime</i>	The UTC time when the snapshot was taken.
<i>totalSnapshots-Found</i>	The number of snapshots that matched the criteria in the received Get Prepay Snapshot command.
<i>commandIndex</i>	Indicates a fragment number if the entire payload won't fit into 1 message.
<i>totalNumber-OfCommands</i>	The total number of subcommands that will be sent.
<i>snapshotCause</i>	A 32-bit bitmap that indicates the cause of the snapshot.
<i>snapshot-PayloadType</i>	An 8-bit enum that defines the format of the snapshot payload.
<i>snapshot-Payload</i>	Data that was created with the snapshot.

```
8.234.3.2 void emberAfPluginPrepaymentServerPublishTopUpLog ( EmberNodeId nodeId, uint8_t
srcEndpoint, uint8_t dstEndpoint, uint8_t commandIndex, uint8_t totalNumberOfCommands,
TopUpPayload * topUpPayload )
```

Sends a Publish Top Up Log command, sent when a top up is performed, or in response to a Get Top Up Log command.

**Parameters**

<i>nodeId</i>	The short address of the destination device.
<i>srcEndpoint</i>	The source endpoint used in the ZigBee transmission.
<i>dstEndpoint</i>	The destination endpoint used in the ZigBee transmission.
<i>commandIndex</i>	Indicates a fragment number if the entire payload won't fit into 1 message.
<i>totalNumber-OfCommands</i>	The total number of subcommands that will be sent.
<i>topUpPayload</i>	Information that is sent from each top up log entry.

```
8.234.3.3 void emberAfPluginPrepaymentServerPublishDebtLog ( EmberNodeId nodeId, uint8_t
srcEndpoint, uint8_t dstEndpoint, uint8_t commandIndex, uint8_t totalNumberOfCommands,
DebtPayload * debtPayload )
```

Sends a Publish Debt Log command.

**Parameters**

<i>nodeId</i>	The short address of the destination device.
<i>srcEndpoint</i>	The source endpoint used in the ZigBee transmission.
<i>dstEndpoint</i>	The destination endpoint used in the ZigBee transmission.
<i>commandIndex</i>	Indicates a fragment number if the entire payload won't fit into 1 message.
<i>totalNumber-OfCommands</i>	The total number of subcommands that will be sent.
<i>debtPayload</i>	Includes the contents of a debt record from the log.

### 8.238.3 Function Documentation

#### 8.238.3.1 void `emberAfPrepaymentClusterScheduleTickCallback` ( uint8\_t endpoint, uint16\_t event )

Sets the event flag and schedules the prepayment tick based on the next expiring pending event.

##### Parameters

<i>endpoint</i>	The endpoint of the device that supports the prepayment server. The event bit that should be set when scheduling the next tick.
-----------------	---

### 8.238.3.2 void emberAfPrepaymentClusterClearPendingEvent ( uint16\_t event )

This function clears an event flag from the pending events bitmask. The event bit that should be cleared.

### Functions

- void [emberAfPluginSendPublishTopUpLog](#) (EmberNodeId nodeId, uint8\_t srcEndpoint, uint8\_t dstEndpoint, uint32\_t latestEndTime, uint8\_t numberOfRecords)
- void [emberAfPluginPrepaymentServerPublishTopUpLog](#) (EmberNodeId nodeId, uint8\_t srcEndpoint, uint8\_t dstEndpoint, uint8\_t commandIndex, uint8\_t totalNumberOfCommands, TopUpPayload \*topUpPayload)

### 8.240.1 Function Documentation

#### 8.240.1.1 void emberAfPluginSendPublishTopUpLog ( EmberNodeId nodeId, uint8\_t srcEndpoint, uint8\_t dstEndpoint, uint32\_t latestEndTime, uint8\_t numberOfRecords )

Formats top up payload data needed by the Publish Top Up Log command.

#### Parameters

<i>nodeId</i>	The address of the destination node to whom the Publish Top Up Log command should be sent.
---------------	--

<i>srcEndpoint</i>	The endpoint of the sender that supports the prepayment cluster.
<i>dstEndpoint</i>	The endpoint on the destination node that supports the prepayment client.
<i>latestEndTime</i>	The latest top up time of top up records to be returned in the Publish Top Up Log command(s).
<i>numberOfRecords</i>	The maximum number of records to return in the Publish Top Up Log command(s).

**8.240.1.2 void emberAfPluginPrepaymentServerPublishTopUpLog ( EmberNodeId nodeId, uint8\_t srcEndpoint, uint8\_t dstEndpoint, uint8\_t commandIndex, uint8\_t totalNumberOfCommands, TopUpPayload \*topUpPayload )**

Sends a Publish Top Up Log command.

#### Parameters

<i>nodeId</i>	The address of the destination node to whom the Publish Top Up Log command should be sent.
<i>srcEndpoint</i>	The endpoint of the sender that supports the prepayment cluster.
<i>dstEndpoint</i>	The endpoint on the destination node that supports the prepayment client.
<i>commandIndex</i>	Indicates which payload fragment is being sent. Set to 0xFE if this is the last expected command.
<i>totalNumberOfCommands</i>	If the payload does not fit into 1 command, this indicates the total number of sub-commands in the message.
<i>topUpPayload</i>	An array of Tup Up Payload structures, containing the payload that should be included in the Publish Top Up Log command.

## 8.242.2 Function Documentation

8.242.2.1 void emAfPluginPriceClientPrintInfo ( uint8\_t *endpoint* )

8.242.2.2 void emAfPluginPriceClientPrintByEventId ( uint8\_t *endpoint*, uint32\_t *issuerEventId* )

8.242.2.3 void emAfPriceClearPriceTable ( uint8\_t *endpoint* )

**8.242.2.4 uint8\_t emAfPriceGetBlockPeriodTableIndexByEventId ( uint8\_t endpoint, uint32\_t issuerEventId )**

Returns the block period table index with a matching eventId.

#### Parameters

<i>endpoint</i>	The relevant endpoint
<i>issuerEventId</i>	The eventId that should be searched for in the block period table.

#### Returns

The index with a valid matching event ID.

**8.242.2.5 void emAfPricePrintBlockPeriodTableIndex ( uint8\_t endpoint, uint8\_t index )**

Prints the information at the specified index of the block period table.

#### Parameters

<i>endpoint</i>	The relevant endpoint
<i>index</i>	The index whose data should be printed.

**8.242.2.6 uint8\_t emAfPriceGetConversionFactorIndexByEventId ( uint8\_t endpoint, uint32\_t issuerEventId )**

Returns the conversion factor table index with a matching eventId.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>issuerEventId</i>	The eventId that should be searched for in the conversion factor table.

#### Returns

The index with a valid matching event ID.

**8.242.2.7 void emAfPricePrintConversionFactorEntryIndex ( uint8\_t endpoint, uint8\_t index )**

Prints the information at the specified index of the conversion factor table.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index whose data should be printed.

### 8.242.2.8 `uint8_t emAfPriceGetCalorificValueIndexByEventId ( uint8_t endpoint, uint32_t issuerEventId )`

Returns the calorific value table index with a matching eventId.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>issuerEventId</i>	The eventId that should be searched for in the calorific value table.

#### Returns

The index with a valid matching event ID.

### 8.242.2.9 `void emAfPricePrintCalorificValueEntryIndex ( uint8_t endpoint, uint8_t index )`

Prints the information at the specified index of the calorific value table.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index whose data should be printed.

### 8.242.2.10 `void emberAfPriceInitConsolidatedBillsTable ( uint8_t endpoint )`

Initializes the consolidated bills table.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
-----------------	------------------------

### 8.242.2.11 `uint8_t emberAfPriceClusterGetActiveCo2ValueIndex ( uint8_t endpoint )`

Returns the index of the currently active CO2 entry, or 0xFF if no active entry can be found.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
-----------------	------------------------

#### Returns

The index of the active CO2 entry.

### 8.242.2.12 `uint8_t emAfPriceGetActiveTierLabelTableIndexByTariffId ( uint8_t endpoint, uint32_t tariffId )`

Returns the index of the currently active tier label table entry, or 0xFF if no active entry can be found.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
-----------------	------------------------

### Returns

The index of the active tier label table entry.

#### **8.242.2.13 void emAfPricePrintTierLabelTableEntryIndex ( uint8\_t endpoint, uint8\_t index )**

Prints the information at the specified index of the tier label table.

### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index whose data should be printed.

#### **8.242.2.14 void emAfPricePrintCo2ValueTablePrintIndex ( uint8\_t endpoint, uint8\_t index )**

Prints the information at the specified index of the CO2 value table.

### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index whose data should be printed.

#### **8.242.2.15 uint8\_t emAfPriceConsolidatedBillTableGetIndexWithEventId ( uint8\_t endpoint, uint32\_t issuerEventId )**

Prints the tier label table.

Returns the consolidated bill table index with a matching eventId.

### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>issuerEventId</i>	The eventId that should be searched for in the consolidated bill table.

### Returns

The index with a valid matching event ID.

#### **8.242.2.16 uint8\_t emAfPriceConsolidatedBillTableGetCurrentIndex ( uint8\_t endpoint )**

Returns the index of the active consolidated bill table.

### Parameters

<i>endpoint</i>	The relevant endpoint.
-----------------	------------------------

### Returns

The index of the consolidated bills table with a valid matching event ID, or 0xFF if no valid match is found.

**8.242.2.17 void emAfPricePrintConsolidatedBillTableIndex ( uint8\_t *endpoint*, uint8\_t *index* )**

Prints the information at the specified index of the consolidated bill table.

**Parameters**

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index whose data should be printed.

**8.242.2.18 void emberAfPricePrintCppEvent ( uint8\_t *endpoint* )**

Prints information about the CPP event.

**Parameters**

<i>endpoint</i>	THe relevant endpoint.
-----------------	------------------------

**8.242.2.19 uint8\_t emAfPriceCreditPaymentTableGetIndexWithEventId ( uint8\_t *endpoint*, uint32\_t *issuerEventId* )**

Returns the credit payment table index with a matching eventId.

**Parameters**

<i>issuerEventId</i>	The eventId that should be searched for in the credit payment table.
----------------------	--

**Returns**

The index with a valid matching event ID.

**8.242.2.20 void emAfPricePrintCreditPaymentTableEventId ( uint32\_t *issuerEventId* )**

Prints the credit payment table entry data of the index with a valid matching eventId.

**Parameters**

<i>endpoint</i>	The relevant endpoint.
<i>issuerEventId</i>	The eventId that should be found in the credit payment table.

**8.242.2.21 void emAfPricePrintCreditPaymentTableIndex ( uint8\_t *endpoint*, uint8\_t *index* )**

Prints the information at the specified index of the credit payment table.

**Parameters**

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index whose data should be printed.

**8.242.2.22 uint8\_t emberAfPriceClusterCurrencyConversionTableGetIndexByEventId ( uint8\_t endpoint, uint32\_t issuerEventId )**

Returns the currency conversion table index with a matching eventId.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>issuerEventId</i>	The eventId that should be searched for in the currency conversion table.

#### Returns

The index with a valid matching event ID.

**8.242.2.23 void emAfPricePrintCurrencyConversionTableIndex ( uint8\_t endpoint, uint8\_t index )**

Prints the information at the specified index of the currency conversion table.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index whose data should be printed.

**8.242.2.24 uint8\_t emberAfPriceClusterGetActiveCurrencyIndex ( uint8\_t endpoint )**

Returns the index of the currently active currency conversion entry, or 0xFF if no active entry can be found.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
-----------------	------------------------

#### Returns

The index of the active currency conversion entry.

**8.242.2.25 uint8\_t emAfPriceGetActiveBillingPeriodIndex ( uint8\_t endpoint )**

Returns the index of the currently active billing period entry, or 0xFF if no active entry can be found.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
-----------------	------------------------

#### Returns

The index of the active billing period entry.

### 8.242.2.26 void emAfPricePrintBillingPeriodTableEntryIndex ( uint8\_t endpoint, uint8\_t index )

Prints the information at the specified index of the billing period table.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index whose data should be printed.

### 8.244.2 Function Documentation

#### 8.244.2.1 uint32\_t emberAfPluginPriceCommonClusterConvertDurationToSeconds ( *uint32\_t startTimeUtc*, *uint32\_t duration*, *uint8\_t durationType* )

Converts the duration to a number of seconds based on the duration type parameter.

#### 8.244.2.2 uint32\_t emberAfPluginPriceCommonClusterGetAdjustedStartTime ( *uint32\_t startTimeUtc*, *uint8\_t durationType* )

Calculates a new UTC start time value based on the duration type parameter.

## 8.246.2 Function Documentation

**8.246.2.1** `uint8_t emberAfPluginPriceCommonGetCommonMatchingOrUnusedIndex ( EmberAfPriceCommonInfo * commonInfos, uint8_t numberOfEntries, uint32_t newIssuerEventId, uint32_t newStartTime, bool expireTimedOut )`

Return the best matching or other index to use for inserting new data.

### Parameters

<code>commonInfos</code>	An array of <a href="#">EmberAfPriceCommonInfo</a> structures whose data is used to find the best available index.
<code>numberOfEntries</code>	The number of entries in the <a href="#">EmberAfPriceCommonInfo</a> array.
<code>newIssuerEventId</code>	The issuerEventId of the new data. This is used to see if a match is present.
<code>newStartTime</code>	The startTime of the new data.
<code>expireTimedOut</code>	Treats any timed-out entries as invalid if set to true.

### Returns

The best index - either a matching index, if found, or an invalid or timed out index.

**8.246.2.2** `void emberAfPluginPriceCommonSort ( EmberAfPriceCommonInfo * commonInfos, uint8_t * dataArray, uint16_t dataArrayBlockSizeInByte, uint16_t dataArraySize )`

Sort Price related data structures.

This semi-generic sorting function can be used to sort all structures that utilizes the [EmberAfPriceCommonInfo](#) data type.

### Parameters

<code>commonInfos</code>	The destination address to which the command should be sent.
<code>dataArray</code>	The source endpoint used in the transmission.
<code>dataArrayBlockSizeInByte</code>	The source endpoint used in the transmission.
<code>dataArraySize</code>	The source endpoint used in the transmission.

**8.246.2.3** `void emberAfPluginPriceCommonUpdateDurationForOverlappingEvents ( EmberAfPriceCommonInfo * commonInfos, uint8_t numberOfEntries )`

Update durations to avoid overlapping next event.

### Parameters

<code>commonInfos</code>	An array of <a href="#">EmberAfPriceCommonInfo</a> structures that will be evaluated.
<code>numberOfEntries</code>	The number of entries in the <a href="#">EmberAfPriceCommonInfo</a> array.

**8.246.2.4 uint32\_t emberAfPluginPriceCommonSecondsUntilSecondIndexActive ( EmberAfPriceCommonInfo \* commonInfos, uint8\_t numberOfEntries )**

Determine time until the next index becomes active.

This function assumes the commonInfos[] array is already sorted by startTime from earliest to latest.

#### Parameters

<i>commonInfos</i>	An array of <a href="#">EmberAfPriceCommonInfo</a> structures that will be evaluated.
<i>numberOfEntries</i>	The number of entries in the <a href="#">EmberAfPriceCommonInfo</a> array.

**8.246.2.5 uint8\_t emberAfPluginPriceCommonFindValidEntries ( uint8\_t \* validEntries, uint8\_t numberOfEntries, EmberAfPriceCommonInfo \* commonInfos, uint32\_t earliestStartTime, uint32\_t minIssuerEventId, uint8\_t numberOfRequestedCommands )**

Find valid entries in the [EmberAfPriceCommonInfo](#) structure array.

#### Parameters

<i>validEntries</i>	An array of the same size as the <a href="#">EmberAfPriceCommonInfo</a> array that will store the valid flag for each entry (true or false).
<i>numberOfEntries</i>	The number of entries in the validEntries array and the commonInfos array.
<i>commonInfos</i>	The <a href="#">EmberAfPriceCommonInfo</a> array that will be searched for valid entries.
<i>earliestStartTime</i>	A minimum start time such that all valid entries have a start time greater than or equal to this value. A minimum event ID such that all valid entries have an issuerEventId greater than or equal to this. The maximum number of valid entries to be returned.

#### Returns

The number of valid commands found in the commonInfos array.

**8.246.2.6 uint8\_t emberAfPluginPriceCommonServerGetActiveIndex ( EmberAfPriceCommonInfo \* commonInfos, uint8\_t numberOfEntries )**

Returns the index of the active entry in the [EmberAfPriceCommonInfo](#) array.

Search through array for the most recent active entry. "Issuer Event Id" has higher priority than "start time".

#### Parameters

<i>commonInfos</i>	The <a href="#">EmberAfPriceCommonInfo</a> array that will be searched for an active entry.
<i>numberOfEntries</i>	The number of entries in the commonInfo array.

#### Returns

The index of the active entry, or 0xFF if an active entry is not found.

### 8.246.2.7 uint8\_t emberAfPluginPriceCommonServerGetFutureIndex ( EmberAfPriceCommonInfo \* commonInfos, uint8\_t numberOfEntries, uint32\_t \* secUntilFutureEvent )

Returns the index to the most recent entry that will become active in the future.

#### Parameters

<i>commonInfos</i>	The <code>EmberAfPriceCommonInfo</code> array that will be searched for the entry. The number of entries in the <code>commonInfo</code> array. The output pointer to the number of seconds until the next active entry.
--------------------	---

#### Returns

The index of the next-active entry, or 0xFF if an active entry is not found.

## 8.248.3 Function Documentation

### 8.248.3.1 void emberAfPriceClusterServerInitTick ( void )

Initializes data used by the price server tick.

### 8.248.3.2 void emberAfPriceClusterScheduleTickCallback ( uint8\_t endpoint, EmberAfPriceServerPendingEvents event )

Sets the event flag and schedules the price tick based on the next expiring pending event.

#### Parameters

<i>endpoint</i>	The endpoint of the device that supports the price server. The event bit that should be set when scheduling the next tick.
-----------------	--

### 8.248.3.3 void emberAfPriceClusterClearPendingEvent ( EmberAfPriceServerPendingEvents event )

This function clears an event flag from the pending events bitmask. The event bit that should be cleared.

Definition at line [283](#) of file [price-server.h](#).

## 8.250.3 Function Documentation

**8.250.3.1 void emberAfPriceServerSendGetScheduledPrices ( uint8\_t *endpoint* )**

Called to send the next Get Scheduled Prices command.

### Parameters

<i>endpoint</i>	The endpoint in question.
-----------------	---------------------------

### **8.250.3.2 uint32\_t emberAfPriceServerSecondsUntilGetScheduledPricesEvent ( void )**

Return the number of seconds until the next Get Scheduled Prices command should be sent.

#### **Returns**

The number of seconds until the next Get Scheduled Prices command should be sent.

### **8.250.3.3 void emberAfPriceClearPriceTable ( uint8\_t endpoint )**

Clear all prices in the price table.

#### **Parameters**

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

### **8.250.3.4 void emberAfPriceClearTariffTable ( uint8\_t endpoint )**

Clear all tariffs in the tariff table.

#### **Parameters**

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

### **8.250.3.5 void emberAfPriceClearPriceMatrixTable ( uint8\_t endpoint )**

Clear all price matrices in the price matrix table.

#### **Parameters**

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

### **8.250.3.6 void emberAfPriceClearBlockThresholdsTable ( uint8\_t endpoint )**

Clear all block thresholds in the block thresholds table.

#### **Parameters**

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

### **8.250.3.7 bool emberAfPriceGetPriceTableEntry ( uint8\_t endpoint, uint8\_t index, EmberAfScheduledPrice \* price )**

Get a price used by the Price server plugin.

This function can be used to get a price and metadata that the plugin will send to clients. For "start now" prices that are current or scheduled, the duration is adjusted to reflect how many minutes remain for the price. Otherwise, the start time and duration of "start now" prices reflect the actual start and the original duration.

**Parameters**

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index in the price table.
<i>price</i>	The <a href="#">EmberAfScheduledPrice</a> structure describing the price.

**Returns**

true if the price was found or false if the index is invalid.

```
8.250.3.8 void emberAfPluginPriceServerBlockPeriodAdd ( uint8_t endpoint, uint32_t providerId,
uint32_t issuerEventId, uint32_t blockPeriodStartTime, uint32_t blockPeriodDuration, uint8_t
blockPeriodControl, uint8_t blockPeriodDurationType, uint32_t thresholdMultiplier, uint32_t
thresholdDivisor, uint8_t tariffType, uint8_t tariffResolutionPeriod )
```

Sets values in the Block Period table.

**Parameters**

<i>endpoint</i>	The relevant endpoint.
<i>providerId</i>	A unique identifier for the commodity provider.
<i>issuerEventId</i>	The event ID of the block period data.
<i>blockPeriod- StartTime</i>	Time at which the block period data is valid.
<i>blockPeriod- Duration</i>	The block period duration. Units are specified by the blockPeriodDurationType.
<i>blockPeriod- Control</i>	Identifies additional control options for the block period command.
<i>blockPeriod- DurationType</i>	A bitmap that indicates the units used in the block period.
<i>tariffType</i>	Bitmap identifying the type of tariff published in this command.
<i>tariff- Resolution- Period</i>	The resolution period for the block tariff.

```
8.250.3.9 void emberAfPluginPriceServerBlockPeriodPub ( uint16_t nodeId, uint8_t srcEndpoint, uint8_t
dstEndpoint, uint8_t index )
```

Sends a Publish Block Period command.

**Parameters**

<i>nodeId</i>	The destination address to which the command should be sent.
<i>srcEndpoint</i>	The source endpoint used in the transmission.
<i>dstEndpoint</i>	The destination endpoint used in the transmission.
<i>index</i>	The index of the table whose data will be used in the command.

```
8.250.3.10 void emberAfPluginPriceServerBlockPeriodPrint ( uint8_t endpoint, uint8_t index )
```

Prints the data in the specified index of the Block Period table.

**Parameters**

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index of the table whose index will be printed.

**8.250.3.11 uint32\_t emberAfPriceServerSecondsUntilBlockPeriodEvent ( uint8\_t *endpoint* )**

Returns the number of seconds until the next block period event will occur.

**Parameters**

<i>endpoint</i>	The relevant endpoint.
-----------------	------------------------

**Returns**

Returns the number of seconds until the next block period event.

**8.250.3.12 void emberAfPriceServerRefreshBlockPeriod ( uint8\_t *endpoint*, bool *repeat* )**

Updates block period attributes to match the current block period.

**Parameters**

<i>endpoint</i>	The relevant endpoint.
<i>repeat</i>	Whether or not to try to repeat the current block period in the next block period. This is also controlled by a bit in the blockPeriodControl, saying whether or not the block period should repeat on expiry.

**8.250.3.13 bool emberAfPriceGetTariffTableEntry ( uint8\_t *endpoint*, uint8\_t *index*, EmberAfPriceCommonInfo \* *info*, EmberAfScheduledTariff \* *tariff* )**

Get a tariff used by the Price server plugin.

This function can be used to get a tariff and associated metadata that the plugin will send to clients.

**Parameters**

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index in the tariff table.
<i>info</i>	The <a href="#">EmberAfPriceCommonInfo</a> structure describing the tariff.
<i>tariff</i>	The <a href="#">EmberAfScheduledTariff</a> structure describing the tariff.

**Returns**

true if the tariff was found

**8.250.3.14 bool emberAfPriceGetPriceMatrix ( uint8\_t *endpoint*, uint8\_t *index*, EmberAfPriceCommonInfo \* *inf*, EmberAfScheduledPriceMatrix \* *pm* )**

Retrieve a price matrix entry by index.

This function can be used to get a price matrix and associated metadata that the plugin will send to clients.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index in the price matrix table.
<i>pm</i>	The <a href="#">EmberAfScheduledPriceMatrix</a> structure describing the price matrix.

#### Returns

true if the price matrix was found

**8.250.3.15 bool emberAfPriceGetBlockThresholdsTableEntry ( uint8\_t *endpoint*, uint8\_t *index*, EmberAfScheduledBlockThresholds \* *bt* )**

Get the block thresholds used by the Price server plugin.

This function can be used to get the block thresholds and associated metadata that the plugin will send to clients.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index in the block thresholds table.
<i>bt</i>	The <a href="#">EmberAfScheduledBlockThresholds</a> structure describing the block thresholds.

#### Returns

true if the block thresholds was found

**8.250.3.16 bool emberAfPriceGetTariffByIssuerTariffId ( uint8\_t *endpoint*, uint32\_t *issuerTariffId*, EmberAfPriceCommonInfo \* *info*, EmberAfScheduledTariff \* *tariff* )**

Get a tariff by issuer tariff ID and endpoint.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>issuerTariffId</i>	The issuer tariff ID.
<i>info</i>	The <a href="#">EmberAfPriceCommonInfo</a> structure describing the tariff.
<i>tariff</i>	The <a href="#">EmberAfScheduledTariff</a> structure describing the tariff.

#### Returns

true if the tariff was found

**8.250.3.17 bool emberAfPriceGetPriceMatrixByIssuerTariffId ( uint8\_t *endpoint*, uint32\_t *issuerTariffId*, EmberAfPriceCommonInfo \* *inf*, EmberAfScheduledPriceMatrix \* *pm* )**

Get a price matrix by issuer tariff ID and endpoint.

**Parameters**

<i>endpoint</i>	The relevant endpoint.
<i>issuerTariffId</i>	The issuer tariff ID.
<i>pm</i>	The <a href="#">EmberAfScheduledPriceMatrix</a> structure describing the price matrix.

**Returns**

true if the price matrix was found

```
8.250.3.18 bool emberAfPriceGetBlockThresholdsByIssuerTariffId ( uint8_t endpoint, uint32_t
issuerTariffId, EmberAfPriceCommonInfo * inf, EmberAfScheduledBlockThresholds *
bt )
```

Get the block thresholds by issuer tariff ID and endpoint.

**Parameters**

<i>endpoint</i>	The relevant endpoint.
<i>issuerTariffId</i>	The issuer tariff ID.
<i>bt</i>	The <a href="#">EmberAfScheduledBlockThresholds</a> structure describing the block thresholds.

**Returns**

true if the block thresholds was found

```
8.250.3.19 bool emberAfPriceSetPriceTableEntry ( uint8_t endpoint, uint8_t index, const
EmberAfScheduledPrice * price )
```

Set a price used by the Price server plugin.

This function can be used to set a price and metadata that the plugin will send to clients. Setting the start time to zero instructs clients to start the price now. For "start now" prices, the plugin will automatically adjust the duration reported to clients based on the original start time of the price.

**Parameters**

<i>endpoint</i>	The relevant endpoint
<i>index</i>	The index in the price table.
<i>price</i>	The <a href="#">EmberAfScheduledPrice</a> structure describing the price. If NULL, the price is removed from the server.

**Returns**

true if the price was set or removed or false is the index is invalid.

```
8.250.3.20 bool emberAfPriceSetTariffTableEntry ( uint8_t endpoint, uint8_t index,
EmberAfPriceCommonInfo * info, const EmberAfScheduledTariff * tariff )
```

Set a tariff used by the Price server plugin.

This function can be used to set a tariff and metadata that the plugin will send to clients.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index in the tariff table.
<i>tariff</i>	The <a href="#">EmberAfScheduledTariff</a> structure describing the tariff. If NULL, the tariff is removed from the server.

#### Returns

true if the tariff was set or removed, or false if the index is invalid.

**8.250.3.21 bool emberAfPriceSetPriceMatrix ( uint8\_t *endpoint*, uint8\_t *index*, EmberAfPriceCommonInfo \* *inf*, const EmberAfScheduledPriceMatrix \* *pm* )**

Set a price matrix entry by index.

This function can be used to set a price matrix and metadata that the plugin will send to clients.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index in the price matrix table.
<i>pm</i>	The <a href="#">EmberAfScheduledPriceMatrix</a> structure describing the price matrix. If NULL, the price matrix is removed from the server.

#### Returns

true if the price matrix was set or removed, or false if the index is invalid.

**8.250.3.22 bool emberAfPriceSetBlockThresholdsTableEntry ( uint8\_t *endpoint*, uint8\_t *index*, const EmberAfPriceCommonInfo \* *inf*, const EmberAfScheduledBlockThresholds \* *bt* )**

Set the block thresholds used by the Price server plugin.

This function can be used to set the block thresholds and metadata that the plugin will send to clients.

#### Parameters

<i>endpoint</i>	The relevant endpoint.
<i>index</i>	The index in the block thresholds table.
<i>bt</i>	The <a href="#">EmberAfScheduledBlockThresholds</a> structure describing the block thresholds. If NULL, the block thresholds entry is removed from the table.

#### Returns

true if the block thresholds was set or removed, or false if the index is invalid.

### 8.250.3.23 bool emberAfGetCurrentPrice ( uint8\_t *endpoint*, EmberAfScheduledPrice \* *price* )

Get the current price used by the Price server plugin.

This function can be used to get the current price and metadata that the plugin will send to clients. For "start now" prices, the duration is adjusted to reflect how many minutes remain for the price. Otherwise, the start time and duration reflect the actual start and the original duration.

#### Parameters

<i>endpoint</i>	The relevant endpoint
<i>price</i>	The <a href="#">EmberAfScheduledPrice</a> structure describing the price.

#### Returns

true if the current price was found or false is there is no current price.

### 8.250.3.24 uint8\_t emberAfPriceFindFreePriceIndex ( uint8\_t *endpoint* )

Find the first free index in the price table.

This function looks through the price table and determines whether the entry is in-use or scheduled to be in use; if not, it's considered "free" for the purposes of the user adding a new price entry to the server's table, and the index is returned.

#### Parameters

<i>endpoint</i>	The relevant endpoint
-----------------	-----------------------

#### Returns

The index of the first free (unused/unscheduled) entry in the requested endpoint's price table, or ZCL\_PRICE\_INVALID\_INDEX if no available entry could be found.

### 8.250.3.25 void emberAfPricePrint ( const EmberAfScheduledPrice \* *price* )

### 8.250.3.26 void emberAfPricePrintPriceTable ( uint8\_t *endpoint* )

### 8.250.3.27 void emberAfPricePrintTariff ( const EmberAfPriceCommonInfo \* *info*, const EmberAfScheduledTariff \* *tariff* )

### 8.250.3.28 void emberAfPricePrintTariffTable ( uint8\_t *endpoint* )

### 8.250.3.29 void emberAfPricePrintPriceMatrix ( uint8\_t *endpoint*, const EmberAfPriceCommonInfo \* *inf*, const EmberAfScheduledPriceMatrix \* *pm* )

### 8.250.3.30 void emberAfPricePrintPriceMatrixTable ( uint8\_t *endpoint* )

### 8.250.3.31 void emberAfPricePrintBlockThresholds ( uint8\_t *endpoint*, const EmberAfPriceCommonInfo \* *inf*, const EmberAfScheduledBlockThresholds \* *bt* )

### 8.250.3.32 void emberAfPricePrintBlockThresholdsTable ( uint8\_t *endpoint* )

**8.250.3.33 void emberAfPluginPriceServerPublishPriceMessage ( EmberNodeId *nodeId*, uint8\_t *srcEndpoint*, uint8\_t *dstEndpoint*, uint8\_t *priceIndex* )**

**8.250.3.34 EmberAfStatus emberAfPluginPriceServerConversionFactorAdd ( uint8\_t *endpoint*, uint32\_t *issuerEventId*, uint32\_t *startTime*, uint32\_t *conversionFactor*, uint8\_t *conversionFactorTrailingDigit* )**

Sets parameters in the conversion factors table.

#### Parameters

<i>endpoint</i>	The endpoint in question
<i>issuerEventId</i>	The event ID of the conversion factor data.
<i>startTime</i>	The time when the conversion factor data is valid.
<i>conversionFactor</i>	Accounts for changes in the volume of gas based on temperature and pressure.
<i>conversionFactorTrailingDigit</i>	Determines where the decimal point is located in the conversion factor.

**8.250.3.35 void emberAfPluginPriceServerConversionFactorClear ( uint8\_t *endpoint* )**

Clears the conversion factors table and invalidates all entries.

#### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

**8.250.3.36 void emberAfPluginPriceServerConversionFactorPub ( uint8\_t *tableIndex*, EmberNodeId *dstAddr*, uint8\_t *srcEndpoint*, uint8\_t *dstEndpoint* )**

Sends a Publish Conversion Factor command using the data at the specified table index.

#### Parameters

<i>tableIndex</i>	The index of the conversion factor table whose data should be used in the publish conversion factor command.
<i>dstAddr</i>	The destination address to which the command should be sent.
<i>srcEp</i>	The source endpoint used in the transmission.
<i>dstEp</i>	The destination endpoint used in the transmission.

**8.250.3.37 uint32\_t emberAfPriceServerSecondsUntilConversionFactorEvent ( uint8\_t *endpoint* )**

Returns the number of seconds until the next conversion factor event will become active.

#### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

## Returns

The number of seconds until the next conversion factor event becomes active.

### 8.250.3.38 void emberAfPriceServerRefreshConversionFactor ( *uint8\_t endpoint* )

Refreshes conversion factor information if necessary. If the second conversion factor event is active, the first is inactivated and the array is re-sorted.

#### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

### 8.250.3.39 EmberAfStatus emberAfPluginPriceServerCalorificValueAdd ( *uint8\_t endpoint, uint32\_t issuerEventId, uint32\_t startTime, uint32\_t calorificValue, uint8\_t calorificValueUnit, uint8\_t calorificValueTrailingDigit* )

Sets values in the Calorific Value table.

#### Parameters

<i>endpoint</i>	The endpoint in question The event ID of the calorific value data. The time at which the calorific value data is valid. The amount of heat generated when a given mass of fuel is burned. Determines where the decimal point is located in the calorific value.
-----------------	---

### 8.250.3.40 uint32\_t emberAfPriceServerSecondsUntilCalorificValueEvent ( *uint8\_t endpoint* )

Returns the number of seconds until the next calorific value event will become active.

#### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

## Returns

The number of seconds until the next calorific value event becomes active.

### 8.250.3.41 void emberAfPriceServerRefreshCalorificValue ( *uint8\_t endpoint* )

Refreshes calorific value information if necessary. If the second calorific value event is active, the first is inactivated and the array is re-sorted.

#### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

#### 8.250.3.42 void emberAfPluginPriceServerCalorificValueClear ( *uint8\_t endpoint* )

Clears the calorific value table and invalidates all entries.

##### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

#### 8.250.3.43 void emberAfPluginPriceServerPublishTariffMessage ( *EmberNodeId nodeId, uint8\_t srcEndpoint, uint8\_t dstEndpoint, uint8\_t tariffIndex* )

Sends a Publish Tariff Information command.

##### Parameters

<i>nodeId</i>	The destination address to which the command should be sent.
<i>srcEndpoint</i>	The source endpoint used in the transmission.
<i>dstEndpoint</i>	The destination endpoint used in the transmission.
<i>tariffIndex</i>	The index of the tariff table whose data will be used in the Publish Tariff Information command.

#### 8.250.3.44 void emberAfPrintConversionTable ( *uint8\_t endpoint* )

Prints the data in the conversion factor table.

##### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

#### 8.250.3.45 void emberAfPrintCalorificValuesTable ( *uint8\_t endpoint* )

Prints the data in the calorific values table.

##### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

#### 8.250.3.46 uint32\_t emberAfPriceServerSecondsUntilCO2ValueEvent ( *uint8\_t endpoint* )

Returns the number of seconds until the next CO2 value event will become active.

##### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

##### Returns

The number of seconds until the next CO2 value event becomes active.

#### 8.250.3.47 void emberAfPriceServerRefreshCO2Value ( *uint8\_t endpoint* )

Refreshes CO2 value information if necessary. If the second CO2 value event is active, the first is inactivated and the array is re-sorted.

##### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

#### 8.250.3.48 void emberAfPluginPriceServerCo2ValueAdd ( *uint8\_t endpoint, uint32\_t issuerEventId, uint32\_t startTime, uint32\_t providerId, uint8\_t tariffType, uint32\_t co2Value, uint8\_t co2ValueUnit, uint8\_t co2ValueTrailingDigit* )

Sets values in the Co2 Value table.

##### Parameters

<i>endpoint</i>	The endpoint in question
<i>issuerEventId</i>	The event ID of the Co2 value table data.
<i>startTime</i>	The time at which the Co2 value data is valid.
<i>providerId</i>	A unique identifier for the commodity provider.
<i>tariffType</i>	Bitmap identifying the type of tariff published in this command
<i>co2Value</i>	Used to calculate the amount of carbon dioxide produced from energy use.
<i>co2ValueUnit</i>	Enum which defines the unit of the co2Value attribute.
<i>co2Value-TrailingDigit</i>	Determines where the decimal point is located in the co2Value.

#### 8.250.3.49 void emberAfPluginPriceServerCo2ValueClear ( *uint8\_t endpoint* )

Clears the Co2 value table and invalidates all entries.

##### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

#### 8.250.3.50 void emberAfPrintCo2ValuesTable ( *uint8\_t endpoint* )

Prints the data in the CO2 values table.

##### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

#### 8.250.3.51 void emberAfPluginPriceServerCo2LabelPub ( *uint16\_t nodeId, uint8\_t srcEndpoint, uint8\_t dstEndpoint, uint8\_t index* )

Sends a Publish CO2 Value command.

**Parameters**

<i>nodeId</i>	The destination address to which the command should be sent.
<i>srcEndpoint</i>	The source endpoint used in the transmission.
<i>dstEndpoint</i>	The destination endpoint used in the transmission.
<i>index</i>	The index of the CO2 values table whose data will be used in the command.

**8.250.3.52 void emberAfPluginPriceServerTierLabelSet ( uint8\_t *endpoint*, uint8\_t *index*, uint8\_t *valid*, uint32\_t *providerId*, uint32\_t *issuerEventId*, uint32\_t *issuerTariffId*, uint8\_t *tierId*, uint8\_t \* *tierLabel* )**

Sets values in the Tier Label table.

**Parameters**

<i>endpoint</i>	The endpoint in question
<i>index</i>	The index of the billing period table whose data will be modified.
<i>valid</i>	Indicates if the data at this index is valid or not.
<i>providerId</i>	A unique identifier for the commodity provider.
<i>issuerEventId</i>	The event ID of the tier labels table data.
<i>issuerTariffId</i>	Unique identifier that identifies which tariff the labels apply to.
<i>tierId</i>	The tier number that associated tier label applies to.
<i>tierLabel</i>	Character string descriptor for this tier.

**8.250.3.53 void emberAfPrintPrintTierLabelsTable ( void )**

**8.250.3.54 void emberAfPluginPriceServerTierLabelAddLabel ( uint8\_t *endpoint*, uint32\_t *issuerTariffId*, uint8\_t *tierId*, uint8\_t \* *tierLabel* )**

Adds a tier label to the specified tier label table.

**Parameters**

<i>endpoint</i>	The endpoint in question
<i>issuerTariffId</i>	Unique identifier that identifies which tariff the labels apply to.
<i>tierId</i>	The tier number that associated tier label applies to.
<i>tierLabel</i>	Character string descriptor for this tier.

**8.250.3.55 void emberAfPrintTierLabelsTable ( uint8\_t *endpoint* )**

Prints the tier labels table.

**Parameters**

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

**8.250.3.56 void emberAfPluginPriceServerTierLabelPub ( uint16\_t *nodeId*, uint8\_t *srcEndpoint*, uint8\_t *dstEndpoint*, uint8\_t *index* )**

Sends a Publish Tier Labels command.

#### Parameters

<i>nodeId</i>	The destination address to which the command should be sent.
<i>srcEndpoint</i>	The source endpoint used in the transmission.
<i>dstEndpoint</i>	The destination endpoint used in the transmission.
<i>index</i>	The index of the tier labels table whose data will be used in the Publish Tier Labels command.

**8.250.3.57 uint32\_t emberAfPriceServerSecondsUntilBillingPeriodEvent ( uint8\_t *endpoint* )**

Returns the number of seconds until the next billing period event will become active.

#### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

#### Returns

The number of seconds until the next billing period event becomes active.

**8.250.3.58 void emberAfPriceServerRefreshBillingPeriod ( uint8\_t *endpoint*, bool *force* )**

Refreshes billing period information if necessary. If the second billing period event is active, the first is inactivated and the array is re-sorted. If the force argument is set to true, then the billing period will be forced to refresh.

#### Parameters

<i>endpoint</i>	The endpoint in question
<i>force</i>	Whether or not the billing period should be forced to refresh.

**8.250.3.59 EmberStatus emberAfPluginPriceServerBillingPeriodAdd ( uint8\_t *endpoint*, uint32\_t *startTime*, uint32\_t *issuerEventId*, uint32\_t *providerId*, uint32\_t *billingPeriodDuration*, uint8\_t *billingPeriodDurationType*, uint8\_t *tariffType* )**

Sets values in the billing period table.

#### Parameters

<i>endpoint</i>	The endpoint in question
<i>startTime</i>	The time at which the billing period data is valid.
<i>issuerEventId</i>	The event ID of the billing period data.
<i>providerId</i>	A unique identifier for the commodity provider.
<i>billingPeriodDuration</i>	The billing period duration. Units are specified by the <i>billingPeriodDurationType</i> .

<i>billingPeriodDurationType</i>	A bitmap that indicates the units used in the billing period.
<i>tariffType</i>	Bitmap identifying the type of tariff published in this command.

**8.250.3.60 void emberAfPluginPriceServerBillingPeriodPub ( uint16\_t *nodeId*, uint8\_t *srcEndpoint*, uint8\_t *dstEndpoint*, uint8\_t *index* )**

Semds a Publish Billing Period command.

#### Parameters

<i>nodeId</i>	The destination address to which the command should be sent.
<i>srcEndpoint</i>	The source endpoint used in the transmission.
<i>dstEndpoint</i>	The destination endpoint used in the transmission.
<i>index</i>	The index of the table whose data will be used in the command.

**8.250.3.61 void emberAfPrintBillingPeriodTable ( uint8\_t *endpoint* )**

Prints the data in the billing period table for the specified endpoint.

#### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

**8.250.3.62 void emberAfPrintConsolidatedBillTableEntry ( uint8\_t *endpoint*, uint8\_t *index* )**

Prints the data in the consolidated bills table at the specified index.

#### Parameters

<i>endpoint</i>	The endpoint in question
<i>index</i>	The index of the consolidated bills table whose data should be printed.

**8.250.3.63 void emberAfPluginPriceServerConsolidatedBillAdd ( uint8\_t *endpoint*, uint32\_t *startTime*, uint32\_t *issuerEventId*, uint32\_t *providerId*, uint32\_t *billingPeriodDuration*, uint8\_t *billingPeriodDurationType*, uint8\_t *tariffType*, uint32\_t *consolidatedBill*, uint16\_t *currency*, uint8\_t *billTrailingDigit* )**

Sets values in the consolidated bills table.

#### Parameters

<i>endpoint</i>	The endpoint in question
<i>startTime</i>	The time at which the consolidated bills data is valid.
<i>issuerEventId</i>	The event ID of the consolidated bills data.
<i>providerId</i>	A unique identifier for the commodity provider.
<i>billingPeriodDuration</i>	The billing period duration. Units are specified by the <i>billingPeriodDurationType</i> .

<i>billingPeriod-DurationType</i>	A bitmap that indicates the units used in the billing period.
<i>tariffType</i>	Bitmap identifying the type of tariff published in this command.
<i>consolidated-Bill</i>	The consolidated bill value for the specified billing period.
<i>currency</i>	The currency used in the consolidatedBill field.
<i>billTrailing-Digit</i>	Determines where the decimal point is located in the consolidatedBill field.

**8.250.3.64 void emberAfPluginPriceServerConsolidatedBillPub ( uint16\_t nodeId, uint8\_t srcEndpoint, uint8\_t dstEndpoint, uint8\_t index )**

Sends a Publish Consolidated Bill command.

#### Parameters

<i>nodeId</i>	The destination address to which the command should be sent.
<i>srcEndpoint</i>	The source endpoint used in the transmission.
<i>dstEndpoint</i>	The destination endpoint used in the transmission.
<i>index</i>	The index of the table whose data will be used in the command.

**8.250.3.65 void emberAfPluginPriceServerCppEventSet ( uint8\_t endpoint, uint8\_t valid, uint32\_t providerId, uint32\_t issuerEventId, uint32\_t startTime, uint16\_t durationInMinutes, uint8\_t tariffType, uint8\_t cppPriceTier, uint8\_t cppAuth )**

Sets values of the Cpp Event.

#### Parameters

<i>endpoint</i>	The endpoint in question.
<i>valid</i>	Indicates if the Cpp Event data is valid or not.
<i>providerId</i>	A unique identifier for the commodity provider.
<i>issuerEventId</i>	The event ID of the Cpp Event.
<i>startTime</i>	The time at which the Cpp Event data is valid.
<i>durationIn-Minutes</i>	Defines the duration of the Cpp Event.
<i>tariffType</i>	Bitmap identifying the type of tariff published in this command.
<i>cppPriceTier</i>	Indicates which CPP price tier should be used for the event.
<i>cppAuth</i>	The status of the CPP event.

**8.250.3.66 void emberAfPluginPriceServerCppEventPub ( uint16\_t nodeId, uint8\_t srcEndpoint, uint8\_t dstEndpoint )**

Sends a Publish CPP Event command.

#### Parameters

<i>nodeId</i>	The destination address to which the command should be sent.
<i>srcEndpoint</i>	The source endpoint used in the transmission.
<i>dstEndpoint</i>	The destination endpoint used in the transmission.

### 8.250.3.67 void emberAfPluginPriceServerCppEventPrint ( uint8\_t *endpoint* )

Prints the data in the CPP Event.

#### Parameters

<i>endpoint</i>	The endpoint in question
-----------------	--------------------------

### 8.250.3.68 void emberAfPluginPriceServerCreditPaymentPub ( uint16\_t *nodeId*, uint8\_t *srcEndpoint*, uint8\_t *dstEndpoint*, uint8\_t *index* )

Sends a Publish Credit Payment command.

#### Parameters

<i>nodeId</i>	The destination address to which the command should be sent.
<i>srcEndpoint</i>	The source endpoint used in the transmission.
<i>dstEndpoint</i>	The destination endpoint used in the transmission.
<i>index</i>	The index of the table whose data will be used in the command.

### 8.250.3.69 void emberAfPluginPriceServerCreditPaymentSet ( uint8\_t *endpoint*, uint8\_t *index*, uint8\_t *valid*, uint32\_t *providerId*, uint32\_t *issuerEventId*, uint32\_t *creditPaymentDueDate*, uint32\_t *creditPaymentOverdueAmount*, uint8\_t *creditPaymentStatus*, uint32\_t *creditPayment*, uint32\_t *creditPaymentDate*, uint8\_t \* *creditPaymentRef* )

Sets values in the credit payment table.

#### Parameters

<i>endpoint</i>	The endpoint in question
<i>index</i>	The index of the credit payment table whose data will be modified.
<i>valid</i>	Indicates if the data at this index is valid or not.
<i>providerId</i>	A unique identifier for the commodity provider.
<i>issuerEventId</i>	The event ID of the credit payment data.
<i>creditPayment-DueDate</i>	The time the next credit payment is due.
<i>creditPayment-Overdue-Amount</i>	The current amount that is overdue from the customer.
<i>creditPayment-Status</i>	Indicates the current credit payment status.
<i>creditPayment</i>	The amount of the last credit payment.
<i>creditPayment-Date</i>	The time at which the last credit payment was made.
<i>creditPayment-Ref</i>	A string used to denote the last credit payment reference used by the energy supplier.

**8.250.3.70 void emberAfPluginPriceServerCurrencyConversionPub ( uint16\_t *nodeId*, uint8\_t *srcEndpoint*, uint8\_t *dstEndpoint* )**

Sends a Publish Currency Conversion command.

#### Parameters

<i>nodeId</i>	The destination address to which the command should be sent.
<i>srcEndpoint</i>	The source endpoint used in the transmission.
<i>dstEndpoint</i>	The destination endpoint used in the transmission.

**8.250.3.71 void emberAfPluginPriceServerCurrencyConversionSet ( uint8\_t *endpoint*, uint8\_t *valid*, uint32\_t *providerId*, uint32\_t *issuerEventId*, uint32\_t *startTime*, uint16\_t *oldCurrency*, uint16\_t *newCurrency*, uint32\_t *conversionFactor*, uint8\_t *conversionFactorTrailingDigit*, uint32\_t *currencyChangeControlFlags* )**

Sets values for the Currency Conversion command.

#### Parameters

<i>endpoint</i>	The endpoint in question
<i>valid</i>	Indicates if the currency conversion data is valid or not.
<i>providerId</i>	A unique identifier for the commodity provider.
<i>issuerEventId</i>	The event ID of the currency conversion data.
<i>startTime</i>	The time at which the currency conversion data is valid.
<i>oldCurrency</i>	Information about the old unit of currency.
<i>newCurrency</i>	Information about the new unit of currency.
<i>conversionFactor</i>	Accounts for changes in the volume of gas based on temperature and pressure.
<i>conversionFactorTrailingDigit</i>	Determines where the decimal point is located in the conversion factor.
<i>currencyChangeControlFlags</i>	Denotes functions that are required to be carried out by the client.

**8.250.3.72 void emberAfPluginPriceServerTariffCancellationSet ( uint8\_t *endpoint*, uint8\_t *valid*, uint32\_t *providerId*, uint32\_t *issuerTariffId*, uint8\_t *tariffType* )**

Sets values in the tariff cancellation command.

#### Parameters

<i>endpoint</i>	The endpoint in question
<i>valid</i>	Indicates if the tariff cancellation command is valid or not.
<i>providerId</i>	A unique identifier for the commodity provider.
<i>issuerTariffId</i>	Unique identifier that identifies which tariff should be cancelled.
<i>tariffType</i>	Bitmap identifying the type of tariff to be cancelled.

8.250.3.73 void emberAfPluginPriceServerTariffCancellationPub ( *uint16\_t nodeId*, *uint8\_t srcEndpoint*,  
*uint8\_t dstEndpoint* )

Sends a Cancel Tariff command.

#### Parameters

<i>nodeId</i>	The destination address to which the command should be sent.
<i>srcEndpoint</i>	The source endpoint used in the transmission.
<i>dstEndpoint</i>	The destination endpoint used in the transmission.

8.250.3.74 *uint32\_t* emberAfPriceServerSecondsUntilTariffInfoEvent ( *uint8\_t endpoint* )

8.250.3.75 void emberAfPriceServerRefreshTariffInformation ( *uint8\_t endpoint* )

8.250.3.76 bool emberAfPriceAddTariffTableEntry ( *uint8\_t endpoint*, EmberAfPriceCommonInfo \*  
*curlInfo*, const EmberAfScheduledTariff \**curTariff* )

8.250.3.77 bool emberAfPriceAddPriceMatrixRaw ( *uint8\_t endpoint*, *uint32\_t providerId*, *uint32\_t issuerEventId*,  
*uint32\_t startTime*, *uint32\_t issuerTariffId*, *uint8\_t commandIndex*, *uint8\_t numberOfCommands*,

### Functions

- void `emberAfPluginRelativeHumidityMeasurementServerSetMeasurementRate` (uint32\_t measurementRateS)

#### 8.252.1 Function Documentation

##### 8.252.1.1 void `emberAfPluginRelativeHumidityMeasurementServerSetMeasurementRate` ( uint32\_t measurementRateS )

Set the hardware read interval.

This function will set the amount of time to wait (in seconds) between polls of the humidity sensor. This function will never set the measurement interval to be greater than the plugin specified maximum measurement interval. If a value of 0 is given, the plugin specified maximum measurement interval will be used for the polling interval.

### 8.274.1 Macro Definition Documentation

#### 8.274.1.1 `#define EMBER_AF_RF4CE_GDP_RAND_SIZE`

Size of the GDP random byte string in bytes (8).

Definition at line 259 of file `rf4ce-gdp-types.h`.

#### 8.274.1.2 `#define EMBER_AF_RF4CE_GDP_TAG_SIZE`

Size of the GDP tag value in in bytes (4).

Definition at line 273 of file `rf4ce-gdp-types.h`.

### 8.274.2 Typedef Documentation

#### 8.274.2.1 `typedef void(* EmberAfRf4ceGdpHeartbeatCallback)(uint8_t, EmberAfRf4ceGdpHeartbeatTrigger)`

RF4CE GDP heartbeat callback. Any module can subscribe to incoming heartbeat commands by using the `emberAfRf4ceGdpSubscribeToHeartbeat()` API. The first parameter is the pairing index, the second parameter is the heartbeat trigger.

Definition at line 85 of file `rf4ce-gdp-types.h`.

### 8.274.3 Enumeration Type Documentation

#### 8.274.3.1 `enum EmberAfRf4ceGdpCommandCode`

RF4CE GDP command codes.

Enumerator:

```
EMBER_AF_RF4CE_GDP_COMMAND_GENERIC_RESPONSE
EMBER_AF_RF4CE_GDP_COMMAND_CONFIGURATION_COMPLETE
EMBER_AF_RF4CE_GDP_COMMAND_HEARTBEAT
EMBER_AF_RF4CE_GDP_COMMAND_GET_ATTRIBUTES
EMBER_AF_RF4CE_GDP_COMMAND_GET_ATTRIBUTES_RESPONSE
EMBER_AF_RF4CE_GDP_COMMAND_PUSH_ATTRIBUTES
EMBER_AF_RF4CE_GDP_COMMAND_SET_ATTRIBUTES
EMBER_AF_RF4CE_GDP_COMMAND_PULL_ATTRIBUTES
EMBER_AF_RF4CE_GDP_COMMAND_PULL_ATTRIBUTES_RESPONSE
EMBER_AF_RF4CE_GDP_COMMAND_CHECK_VALIDATION
EMBER_AF_RF4CE_GDP_COMMAND_CLIENT_NOTIFICATION
EMBER_AF_RF4CE_GDP_COMMAND_KEY_EXCHANGE
```

Definition at line 10 of file `rf4ce-gdp-types.h`.

### 8.274.3.2 enum EmberAfRf4ceGdpResponseCode

RF4CE GDP response codes.

Enumerator:

- EMBER\_AF\_RF4CE\_GDP\_RESPONSE\_CODE\_SUCCESSFUL*
- EMBER\_AF\_RF4CE\_GDP\_RESPONSE\_CODE\_UNSUPPORTED\_REQUEST*
- EMBER\_AF\_RF4CE\_GDP\_RESPONSE\_CODE\_INVALID\_PARAMETER*
- EMBER\_AF\_RF4CE\_GDP\_RESPONSE\_CODE\_CONFIGURATION\_FAILURE*

Definition at line 34 of file [rf4ce-gdp-types.h](#).

### 8.274.3.3 enum EmberAfRf4ceGdpStatus

RF4CE GDP statuses.

Enumerator:

- EMBER\_AF\_RF4CE\_GDP\_STATUS\_SUCCESSFUL*
- EMBER\_AF\_RF4CE\_GDP\_STATUS\_CONFIGURATION\_FAILURE*

Definition at line 50 of file [rf4ce-gdp-types.h](#).

### 8.274.3.4 enum EmberAfRf4ceGdpHeartbeatTrigger

RF4CE GDP heartbeat triggers.

Enumerator:

- EMBER\_AF\_RF4CE\_GDP\_HEARTBEAT\_TRIGGER\_GENERIC\_ACTIVITY*
- EMBER\_AF\_RF4CE\_GDP\_HEARTBEAT\_TRIGGER\_TIME\_BASED\_POLLING*
- EMBER\_AF\_RF4CE\_GDP\_HEARTBEAT\_TRIGGER\_POLLING\_ON\_KEY\_PRESS*
- EMBER\_AF\_RF4CE\_GDP\_HEARTBEAT\_TRIGGER\_POLLING\_ON\_PICKUP*
- EMBER\_AF\_RF4CE\_GDP\_HEARTBEAT\_TRIGGER\_POLLING\_ON\_RESET*
- EMBER\_AF\_RF4CE\_GDP\_HEARTBEAT\_TRIGGER\_POLLING\_ON\_MICROPHONE\_ACTIVITY*
  
- EMBER\_AF\_RF4CE\_GDP\_HEARTBEAT\_TRIGGER\_POLLING\_ON\_OTHER\_USER\_ACTIVITY*

Definition at line 64 of file [rf4ce-gdp-types.h](#).

### 8.274.3.5 enum EmberAfRf4ceGdpAttributeId

RF4CE GDP attribute ids.

Enumerator:

- EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_VERSION*

*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_CAPABILITIES*  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_KEY\_EXCHANGE\_TRANSFER\_COUNT*

*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_POLL\_CONSTRAINTS*  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_POLL\_CONFIGURATION*  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_MAX\_PAIRING\_CANDIDATES*  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_AUTO\_CHECK\_VALIDATION\_PERIOD*  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_BINDING\_RECIPIENT\_VALIDATION\_WAIT\_TIME*  
  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_BINDING\_INITIATOR\_VALIDATION\_WAIT\_TIME*  
  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_LINK\_LOST\_WAIT\_TIME*  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_IDENTIFICATION\_CAPABILITIES*

Definition at line 91 of file [rf4ce-gdp-types.h](#).

#### 8.274.3.6 enum EmberAfRf4ceGdpAttributeStatus

RF4CE GDP attribute statuses.

Enumerator:

*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_STATUS\_SUCCESS*  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_STATUS\_UNSUPPORTED\_ATTRIBUTE*  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_STATUS\_ILLEGAL\_REQUEST*  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_STATUS\_INVALID\_ENTRY*  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_STATUS\_NO\_RESPONSE*  
*EMBER\_AF\_RF4CE\_GDP\_ATTRIBUTE\_STATUS\_INVALID\_RESPONSE*

Definition at line 115 of file [rf4ce-gdp-types.h](#).

#### 8.274.3.7 enum EmberAfRf4ceGdpCheckValidationSubtype

RF4CE GDP Check Validation subtypes.

Enumerator:

*EMBER\_AF\_RF4CE\_GDP\_CHECK\_VALIDATION\_SUBTYPE\_REQUEST*  
*EMBER\_AF\_RF4CE\_GDP\_CHECK\_VALIDATION\_SUBTYPE\_RESPONSE*

Definition at line 167 of file [rf4ce-gdp-types.h](#).

### 8.274.3.8 enum EmberAfRf4ceGdpCheckValidationStatus

RF4CE GDP Check Validation statuses.

Enumerator:

*EMBER\_AF\_RF4CE\_GDP\_CHECK\_VALIDATION\_STATUS\_SUCCESS  
 EMBER\_AF\_RF4CE\_GDP\_CHECK\_VALIDATION\_STATUS\_PENDING  
 EMBER\_AF\_RF4CE\_GDP\_CHECK\_VALIDATION\_STATUS\_TIMEOUT

Definition at line 211 of file [rf4ce-gdp-types.h](#).

### 8.274.3.11 enum EmberAfRf4ceGdpKeyExchangeSubtype

RF4CE GDP Key Exchange subtypes.

Enumerator:

*EMBER\_AF\_RF4CE\_GDP\_KEY\_EXCHANGE\_SUBTYPE\_CHALLENGE  
 EMBER\_AF\_RF4CE\_GDP\_KEY\_EXCHANGE\_SUBTYPE\_CHALLENGE\_RESPONSE  
 EMBER\_AF\_RF4CE\_GDP\_KEY\_EXCHANGE\_SUBTYPE\_RESPONSE  
 EMBER\_AF\_RF4CE\_GDP\_KEY\_EXCHANGE\_SUBTYPE\_CONFIRM*

Definition at line 227 of file [rf4ce-gdp-types.h](#).

### 8.274.3.12 enum EmberAfRf4ceGdpKeyExchangeFlags

RF4CE GDP Key Exchange flags.

Enumerator:

```
EMBER_AF_RF4CE_GDP_KEY_EXCHANGE_FLAG_STANDARD_SHARED_SECRET
EMBER_AF_RF4CE_GDP_KEY_EXCHANGE_FLAG_INITIATOR_VENDOR_SPECIFIC_SECRET

EMBER_AF_RF4CE_GDP_KEY_EXCHANGE_FLAG_RESPONDER_VENDOR_SPECIFIC_SECRET

EMBER_AF_RF4CE_GDP_KEY_EXCHANGE_FLAG_VENDOR_SPECIFIC_PARAMETER_MASK

EMBER_AF_RF4CE_GDP_KEY_EXCHANGE_FLAG_VENDOR_SPECIFIC_PARAMETER_OFFSET
```

Definition at line 243 of file [rf4ce-gdp-types.h](#).

### 8.274.3.13 enum EmberAfRf4ceGdpBindingState

RF4CE GDP binding states.

Enumerator:

```
EMBER_AF_RF4CE_GDP_BINDING_STATE_DORMANT
EMBER_AF_RF4CE_GDP_BINDING_STATE_NOT_BOUND
EMBER_AF_RF4CE_GDP_BINDING_STATE_BINDING
EMBER_AF_RF4CE_GDP_BINDING_STATE_BOUND
```

Definition at line 288 of file [rf4ce-gdp-types.h](#).

### 8.274.3.14 enum EmberAfRf4ceGdpBindingStatus

RF4CE GDP binding statuses.

Enumerator:

```
EMBER_AF_RF4CE_GDP_BINDING_STATUS_SUCCESS
EMBER_AF_RF4CE_GDP_BINDING_STATUS_DUPLICATE_CLASS_ABORT
EMBER_AF_RF4CE_GDP_BINDING_STATUS_NO_VALID_RESPONSE
EMBER_AF_RF4CE_GDP_BINDING_STATUS_PAIRING_FAILED
EMBER_AF_RF4CE_GDP_BINDING_STATUS_CONFIG_FAILED
EMBER_AF_RF4CE_GDP_BINDING_STATUS_PROFILE_SPECIFIC_CONFIG_FAILED
EMBER_AF_RF4CE_GDP_BINDING_STATUS_VALIDATION_FAILED
```

Definition at line 304 of file [rf4ce-gdp-types.h](#).

### 8.274.3.15 enum EmberAfRf4ceGdpPollingTrigger

RF4CE GDP polling triggers.

Enumerator:

*EMBER\_AF\_RF4CE\_GDP\_POLLING\_TRIGGER\_TIME\_BASED\_POLLING\_ENABLED  
 EMBER\_AF\_RF4CE\_GDP\_POLLING\_TRIGGER\_POLLING\_ON\_KEY\_PRESS\_ENABLED  
 EMBER\_AF\_RF4CE\_GDP\_POLLING\_TRIGGER\_POLLING\_ON\_PICK\_UP\_ENABLED  
 EMBER\_AF\_RF4CE\_GDP\_POLLING\_TRIGGER\_POLLING\_ON\_RESET\_ENABLED  
 EMBER\_AF\_RF4CE\_GDP\_POLLING\_TRIGGER\_POLLING\_ON\_MICROPHONE\_ACTIVITY\_ENABLED  
 EMBER\_AF\_RF4CE\_GDP\_POLLING\_TRIGGER\_POLLING\_ON\_OTHER\_USER\_ACTIVITY\_ENABLED*

Definition at line 323 of file [rf4ce-gdp-types.h](#).

### 8.274.3.16 enum EmberAfRf4ceGdpPollingMethod

RF4CE GDP polling methods.

Enumerator:

*EMBER\_AF\_RF4CE\_GDP\_POLLING\_METHOD\_DISABLED  
 EMBER\_AF\_RF4CE\_GDP\_POLLING\_METHOD\_HEARTBEAT*

Definition at line 341 of file [rf4ce-gdp-types.h](#).

### 8.290.1 Enumeration Type Documentation

### 8.290.1.1 enum EmberAfRf4ceMsoBindingState

RF4CE MSO binding states.

Enumerator:

*EMBER\_AF\_RF4CE\_MSO\_BINDING\_STATE\_NOT\_BOUND*  
*EMBER\_AF\_RF4CE\_MSO\_BINDING\_STATE\_BINDING*  
*EMBER\_AF\_RF4CE\_MSO\_BINDING\_STATE\_BOUND*

Definition at line 10 of file [rf4ce-mso-types.h](#).

### 8.290.1.2 enum EmberAfRf4ceMsoValidationState

RF4CE MSO validation states.

Enumerator:

*EMBER\_AF\_RF4CE\_MSO\_VALIDATION\_STATE\_NOT\_VALIDATED*  
*EMBER\_AF\_RF4CE\_MSO\_VALIDATION\_STATE\_REJECTED*  
*EMBER\_AF\_RF4CE\_MSO\_VALIDATION\_STATE\_VALIDATING*  
*EMBER\_AF\_RF4CE\_MSO\_VALIDATION\_STATE\_REVALIDATING*  
*EMBER\_AF\_RF4CE\_MSO\_VALIDATION\_STATE\_VALIDATED*

Definition at line 25 of file [rf4ce-mso-types.h](#).

### 8.290.1.3 enum EmberAfRf4ceMsoCommandCode

RF4CE MSO command codes.

Enumerator:

*EMBER\_AF\_RF4CE\_MSO\_COMMAND\_USER\_CONTROL\_PRESSED*  
*EMBER\_AF\_RF4CE\_MSO\_COMMAND\_USER\_CONTROL\_REPEAT*  
*EMBER\_AF\_RF4CE\_MSO\_COMMAND\_USER\_CONTROL\_RELEASED*  
*EMBER\_AF\_RF4CE\_MSO\_COMMAND\_CHECK\_VALIDATION\_REQUEST*  
*EMBER\_AF\_RF4CE\_MSO\_COMMAND\_CHECK\_VALIDATION\_RESPONSE*  
*EMBER\_AF\_RF4CE\_MSO\_COMMAND\_SET\_ATTRIBUTE\_REQUEST*  
*EMBER\_AF\_RF4CE\_MSO\_COMMAND\_SET\_ATTRIBUTE\_RESPONSE*  
*EMBER\_AF\_RF4CE\_MSO\_COMMAND\_GET\_ATTRIBUTE\_REQUEST*  
*EMBER\_AF\_RF4CE\_MSO\_COMMAND\_GET\_ATTRIBUTE\_RESPONSE*

Definition at line 42 of file [rf4ce-mso-types.h](#).

#### 8.290.1.4 enum EmberAfRf4ceMsoKeyCode

RF4CE MSO key codes.

Enumerator:

### 8.290.1.5 enum EmberAfRf4ceMsoCheckValidationControl

RF4CE MSO check validation statuses.

Enumerator:

***EMBER\_AF\_RF4CE\_MSO\_CHECK\_VALIDATION\_CONTROL\_REQUEST\_AUTOMATIC\_VALIDATION***

Definition at line 235 of file [rf4ce-mso-types.h](#).

### 8.290.1.6 enum EmberAfRf4ceMsoCheckValidationStatus

RF4CE MSO check validation statuses.

Enumerator:

***EMBER\_AF\_RF4CE\_MSO\_CHECK\_VALIDATION\_STATUS\_SUCCESS*** The validation is successful.

***EMBER\_AF\_RF4CE\_MSO\_CHECK\_VALIDATION\_STATUS\_PENDING*** The validation is still in progress.

***EMBER\_AF\_RF4CE\_MSO\_CHECK\_VALIDATION\_STATUS\_TIMEOUT*** The validation timed out, and the binding procedure SHOULD continue with other devices in the list.

***EMBER\_AF\_RF4CE\_MSO\_CHECK\_VALIDATION\_STATUS\_COLLISION*** The validation was terminated at the target side, as more than one controller tried to pair.

***EMBER\_AF\_RF4CE\_MSO\_CHECK\_VALIDATION\_STATUS\_FAILURE*** The validation failed, and the binding procedure SHOULD continue with other devices in the list.

***EMBER\_AF\_RF4CE\_MSO\_CHECK\_VALIDATION\_STATUS\_ABORT*** The validation is aborted, and the binding procedure SHOULD continue with other devices in the list.

***EMBER\_AF\_RF4CE\_MSO\_CHECK\_VALIDATION\_STATUS\_FULL\_ABORT*** The validation is aborted, and the binding procedure SHOULD NOT continue with other devices in the list.

Definition at line 248 of file [rf4ce-mso-types.h](#).

### 8.290.1.7 enum EmberAfRf4ceMsoBindingStatus

Enumerator:

***EMBER\_AF\_RF4CE\_MSO\_BINDING\_STATUS\_SUCCESS***

***EMBER\_AF\_RF4CE\_MSO\_BINDING\_STATUS\_NO\_VALID\_RESPONSE***

***EMBER\_AF\_RF4CE\_MSO\_BINDING\_STATUS\_NO\_VALID\_CANDIDATE***

Definition at line 279 of file [rf4ce-mso-types.h](#).

### 8.290.1.8 enum EmberAfRf4ceMsoAttributeId

RF4CE MSO attribute ids.

Enumerator:

- EMBER\_AF\_RF4CE\_MSO\_ATTRIBUTE\_ID\_PERIPHERAL\_IDS*
- EMBER\_AF\_RF4CE\_MSO\_ATTRIBUTE\_ID\_RF\_STATISTICS*
- EMBER\_AF\_RF4CE\_MSO\_ATTRIBUTE\_ID\_VERSIONING*
- EMBER\_AF\_RF4CE\_MSO\_ATTRIBUTE\_ID\_BATTERY\_STATUS*
- EMBER\_AF\_RF4CE\_MSO\_ATTRIBUTE\_ID\_SHORT\_RF\_RETRY\_PERIOD*
- EMBER\_AF\_RF4CE\_MSO\_ATTRIBUTE\_ID\_IR\_RF\_DATABASE*
- EMBER\_AF\_RF4CE\_MSO\_ATTRIBUTE\_ID\_VALIDATION\_CONFIGURATION*
- EMBER\_AF\_RF4CE\_MSO\_ATTRIBUTE\_ID\_GENERAL\_PURPOSE*

Definition at line 301 of file [rf4ce-mso-types.h](#).

### 8.290.1.9 enum EmberAfRf4ceMsoIrRfDatabaseFlags

RF4CE MSO IR-RF database entry flags.

Enumerator:

- EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_FLAG\_NONE* No flags.
- EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_FLAG\_RF\_PRESSED\_SPECIFIED* Indicates that an RF pressed descriptor is included in this attribute, and that an RF message should be generated when this key is pressed. If Use Default is set, this field should be ignored (treated as if it was zero).
- EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_FLAG\_RF\_REPEATED\_SPECIFIED* Indicates that an RF repeated descriptor is included in this attribute, and that an RF message should be generated when this key is kept pressed. If Use Default is set, this field should be ignored (treated as if it was zero).
- EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_FLAG\_RF\_RELEASED\_SPECIFIED* Indicates that an RF released descriptor is included in this attribute, and that an RF message should be generated when this key is released. If Use Default is set, this field should be ignored (treated as if it was zero).
- EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_FLAG\_IR\_SPECIFIED* Indicates that an IR descriptor is included in this attribute, and that an IR message should be generated when this key is pressed and kept pressed. If Use Default is set, this field should be ignored (treated as if it was zero).
- EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_FLAG\_DEVICE\_TYPE\_MASK* Represents the device type of the IR descriptor if the IR Specified flag is set.
- EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_FLAG\_USE\_DEFAULT* Indicates that the default (known by the RC) RF and IR codes should be used.
- EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_FLAG\_PERMANENT* Indicates that the codes are permanent and can be used for all further presses of this key.

Definition at line 333 of file [rf4ce-mso-types.h](#).

### 8.290.1.10 enum EmberAfRf4ceMsoIrRfDatabaseDeviceType

RF4CE MSO IR-RF database device types.

**Enumerator:**

***EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_DEVICE\_TYPE\_TV*** The device type of the IR descriptor is for a TV.

***EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_DEVICE\_TYPE\_AVR*** The device type of the IR descriptor is for ab AVR.

Definition at line 383 of file [rf4ce-mso-types.h](#).

### 8.290.1.11 enum EmberAfRf4ceMsoIrRfDatabaseRfConfig

RF4CE MSO IR-RF database RF config.

**Enumerator:**

***EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_RF\_CONFIG\_MINIMUM\_NUMBER\_OF\_TRANSMISSIONS\_MASK***  
Indicates the minimum number of transmissions for this code. For acknowledged RF transmissions, this field is set to '1'.

***EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_RF\_CONFIG\_KEEP\_TRANSMITTING\_UNTIL\_KEY\_RELEASE***  
Indicates if the code should continue being transmitted after the minimum number of transmissions have taken place, when the key is kept pressed. (This field only applies to RF Repeated frames.)

***EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_RF\_CONFIG\_SHORT\_RETRY*** Indicates if the RF4CE retry period for UAM messages should be shorted for this code to increase responsiveness of the system.

Definition at line 399 of file [rf4ce-mso-types.h](#).

### 8.290.1.12 enum EmberAfRf4ceMsoIrRfDatabaseIrConfig

RF4CE MSO IR-RF database IR config.

**Enumerator:**

***EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_IR\_CONFIG\_MINIMUM\_NUMBER\_OF\_TRANSMISSIONS\_MASK***  
Indicates the minimum number of transmissions for the IR repeat frames. Only valid when Tweak Database is set to '1', otherwise follow behavior as defined by database. Special case: when Tweak Database is set to '1', setting this field to 0xF enforces the use of the value from the database.

***EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_IR\_CONFIG\_KEEP\_TRANSMITTING\_UNTIL\_KEY\_RELEASE***  
Indicates if the repeat frames should continue being transmitted after the minimum number of transmissions as defined by the database have been performed, in case the key remains pressed. Only valid when Tweak Database is set to '1', otherwise follow behavior as defined by database.

***EMBER\_AF\_RF4CE\_MSO\_IR\_RF\_DATABASE\_IR\_CONFIG\_SHORT\_RETRY*** Indicates that database behavior should be tweaked, using the "Minimum number of transmissions" and "Keep Transmitting Until Key Release" fields.

## 8.296.1 Typedef Documentation

- 8.296.1.1 `typedef void(* EmberAfRf4cePairCompleteCallback)(uint8_t, EmberStatus, const EmberRf4ceVendorInfo *, const EmberRf4ceApplicationInfo *)`

Function type definition of the pair complete callback.

Definition at line 123 of file `rf4ce-profile-types.h`.

## 8.296.2 Enumeration Type Documentation

- 8.296.2.1 `enum EmberAfRf4ceStatus`

ZigBee RF4CE status.

Enumerator:

```
EMBER_AF_RF4CE_STATUS_SUCCESS
EMBER_AF_RF4CE_STATUS_NO_ORG_CAPACITY
EMBER_AF_RF4CE_STATUS_NO_REC_CAPACITY
EMBER_AF_RF4CE_STATUS_NO_PAIRING
EMBER_AF_RF4CE_STATUS_NO_RESPONSE
EMBER_AF_RF4CE_STATUS_NOT_PERMITTED
EMBER_AF_RF4CE_STATUS_DUPLICATE_PAIRING
EMBER_AF_RF4CE_STATUS_FRAME_COUNTER_EXPIRED
EMBER_AF_RF4CE_STATUS_DISCOVERY_ERROR
EMBER_AF_RF4CE_STATUS_DISCOVERY_TIMEOUT
EMBER_AF_RF4CE_STATUS_SECURITY_TIMEOUT
EMBER_AF_RF4CE_STATUS_SECURITY_FAILURE
EMBER_AF_RF4CE_STATUS_INVALID_PARAMETER
EMBER_AF_RF4CE_STATUS_UNSUPPORTED_ATTRIBUTE
EMBER_AF_RF4CE_STATUS_INVALID_INDEX
```

Definition at line 10 of file `rf4ce-profile-types.h`.

### 8.296.2.2 enum EmberAfRf4ceProfileId

ZigBee RF4CE profile identifier.

**Enumerator:**

***EMBER\_AF\_RF4CE\_PROFILE\_GENERIC\_DEVICE*** Generic Device Profile (GDP) versions 1.-0 and 2.0.

***EMBER\_AF\_RF4CE\_PROFILE\_CONSUMER\_ELECTRONICS\_REMOTE\_CONTROL*** The Consumer Electronics Remote Control (CERC) profile was renamed to the ZigBee Remote Control (ZRC) profile when the specification went from version 1.0 in document 09-4946-00 to version 1.1 in document 09-4946-01. 1.1 is backwards compatible with 1.0. For convenience, the profile can be referred to as CERC, ZRC 1.0, or ZRC 1.1.

***EMBER\_AF\_RF4CE\_PROFILE\_REMOTE\_CONTROL\_1\_0*** A convenience alias for [\*\*\*EMBER\\_AF\\_RF4CE\\_PROFILE\\_CONSUMER\\_ELECTRONICS\\_REMOTE\\_CONTROL\*\*\*](#).

***EMBER\_AF\_RF4CE\_PROFILE\_REMOTE\_CONTROL\_1\_1*** ZigBee Remote Control (ZRC) profile version 1.1.

***EMBER\_AF\_RF4CE\_PROFILE\_INPUT\_DEVICE\_1\_0*** ZigBee Input Device (ZID) profile version 1.0.

***EMBER\_AF\_RF4CE\_PROFILE\_REMOTE\_CONTROL\_2\_0*** ZigBee Remote Control (ZRC) profile version 2.0.

***EMBER\_AF\_RF4CE\_PROFILE\_MSO*** Multiple System Operators (MSO) profile.

***EMBER\_AF\_RF4CE\_PROFILE\_WILDCARD*** Wildcard profile.

Definition at line [37](#) of file [rf4ce-profile-types.h](#).

### 8.296.2.3 enum EmberAfRf4ceVendor

ZigBee RF4CE vendor identifier.

**Enumerator:**

***EMBER\_AF\_RF4CE\_VENDOR\_PANASONIC***  
***EMBER\_AF\_RF4CE\_VENDOR\_SONY***  
***EMBER\_AF\_RF4CE\_VENDOR\_SAMSUNG***  
***EMBER\_AF\_RF4CE\_VENDOR\_PHILIPS***  
***EMBER\_AF\_RF4CE\_VENDOR\_FREESCALE***  
***EMBER\_AF\_RF4CE\_VENDOR\_OKI\_SEMICONDUCTOR***  
***EMBER\_AF\_RF4CE\_VENDOR\_TEXAS\_INSTRUMENTS***  
***EMBER\_AF\_RF4CE\_VENDOR\_TEST\_VENDOR\_1***  
***EMBER\_AF\_RF4CE\_VENDOR\_TEST\_VENDOR\_2***  
***EMBER\_AF\_RF4CE\_VENDOR\_TEST\_VENDOR\_3***

Definition at line [72](#) of file [rf4ce-profile-types.h](#).

#### 8.296.2.4 enum EmberAfRf4ceDeviceType

ZigBee RF4CE device type.

Enumerator:

```
EMBER_AF_RF4CE_DEVICE_TYPE_RESERVED
EMBER_AF_RF4CE_DEVICE_TYPE_REMOTE_CONTROL
EMBER_AF_RF4CE_DEVICE_TYPE_TELEVISION
EMBER_AF_RF4CE_DEVICE_TYPE_PROJECTOR

### 8.302.1 Macro Definition Documentation

#### 8.302.1.1 #define EMBER\_AF\_RF4CE\_ZRC\_COMMANDS\_SUPPORTED\_SIZE

Size of the ZRC 1.x command discovery data in bytes (32).

Definition at line 128 of file [rf4ce-zrc11-types.h](#).

### 8.302.2 Enumeration Type Documentation

#### 8.302.2.1 enum EmberAfRf4ceZrcCommandCode

RF4CE ZRC 1.1 command codes.

Enumerator:

```
EMBER_AF_RF4CE_ZRC_COMMAND_USER_CONTROL_PRESSED
EMBER_AF_RF4CE_ZRC_COMMAND_USER_CONTROL_REPEATED
EMBER_AF_RF4CE_ZRC_COMMAND_USER_CONTROL_RELEASED
EMBER_AF_RF4CE_ZRC_COMMAND_COMMAND_DISCOVERY_REQUEST
EMBER_AF_RF4CE_ZRC_COMMAND_COMMAND_DISCOVERY_RESPONSE
EMBER_AF_RF4CE_ZRC_COMMAND_USER_CONTROL_PRESSED
EMBER_AF_RF4CE_ZRC_COMMAND_USER_CONTROL_REPEATED
EMBER_AF_RF4CE_ZRC_COMMAND_USER_CONTROL_RELEASED
EMBER_AF_RF4CE_ZRC_COMMAND_COMMAND_DISCOVERY_REQUEST
EMBER_AF_RF4CE_ZRC_COMMAND_COMMAND_DISCOVERY_RESPONSE
EMBER_AF_RF4CE_ZRC_COMMAND_ACTIONS
```

Definition at line 10 of file [rf4ce-zrc11-types.h](#).

#### 8.302.2.2 enum EmberAfRf4ceUserControlCode

RF4CE user control codes from HDMI 1.3a CEC operand [UI Command].

Enumerator:

```
EMBER_AF_RF4CE_USER_CONTROL_CODE_SELECT
EMBER_AF_RF4CE_USER_CONTROL_CODE_UP
EMBER_AF_RF4CE_USER_CONTROL_CODE_DOWN
EMBER_AF_RF4CE_USER_CONTROL_CODE_LEFT

### 8.328.1 Macro Definition Documentation

#### 8.328.1.1 #define EMBER\_AF\_RF4CE\_ZRC\_ATTRIBUTE\_NAMES

Definition at line 32 of file [rf4ce-zrc20-types.h](#).

#### 8.328.1.2 #define EMBER\_AF\_RF4CE\_ZRC\_ACTION\_MAPPING\_MAPPING\_FLAGS\_RF\_SPECIFIED\_BIT

RF4CE ZRC action mapping: Mapping Flags field.

Definition at line 378 of file [rf4ce-zrc20-types.h](#).

#### 8.328.1.3 #define EMBER\_AF\_RF4CE\_ZRC\_ACTION\_MAPPING\_MAPPING\_FLAGS\_IR\_SPECIFIED\_BIT

Definition at line 379 of file [rf4ce-zrc20-types.h](#).

#### 8.328.1.4 #define EMBER\_AF\_RF4CE\_ZRC\_ACTION\_MAPPING\_MAPPING\_FLAGS\_RF\_DESCRIPTOR\_FIRST\_BIT

Definition at line 380 of file [rf4ce-zrc20-types.h](#).

#### 8.328.1.5 #define EMBER\_AF\_RF4CE\_ZRC\_ACTION\_MAPPING\_MAPPING\_FLAGS\_USE\_DEFAULT\_BIT

Definition at line 382 of file [rf4ce-zrc20-types.h](#).

#### 8.328.1.6 #define EMBER\_AF\_RF4CE\_ZRC\_ACTION\_MAPPING\_MAPPING\_FLAGS\_PERMANENT\_BIT

Definition at line 383 of file [rf4ce-zrc20-types.h](#).

#### 8.328.1.7 #define RF4CE\_ZRC\_ACTION\_MAPPING\_RF\_CONFIG\_KEEP\_TRANSMITTING\_UNTIL\_KEY\_RELEASE

RF4CE ZRC action mapping: RF Config field.

Definition at line 389 of file [rf4ce-zrc20-types.h](#).

#### 8.328.1.8 #define RF4CE\_ZRC\_ACTION\_MAPPING\_RF\_CONFIG\_SHORT\_RF\_RETRY

Definition at line 390 of file [rf4ce-zrc20-types.h](#).

#### 8.328.1.9 #define RF4CE\_ZRC\_ACTION\_MAPPING\_RF\_CONFIG\_ATOMIC\_ACTION

Definition at line 391 of file [rf4ce-zrc20-types.h](#).

#### 8.328.1.10 #define RF4CE\_ZRC\_ACTION\_MAPPING\_IR\_CONFIG\_VENDOR\_SPECIFIC

RF4CE ZRC action mapping: IR Config field.

Definition at line 397 of file [rf4ce-zrc20-types.h](#).

### 8.328.1.11 #define EMBER\_AF\_RF4CE\_ZRC\_COMMANDS\_SUPPORTED\_SIZE

Size of the ZRC 1.x command discovery data in bytes (32).

Definition at line 437 of file [rf4ce-zrc20-types.h](#).

## 8.328.2 Typedef Documentation

### 8.328.2.1 typedef uint8\_t EmberAfRf4ceZrcActionCode

Definition at line 173 of file [rf4ce-zrc20-types.h](#).

## 8.328.3 Enumeration Type Documentation

### 8.328.3.1 enum EmberAfRf4ceZrcAttributeId

RF4CE ZRC attribute ids.

Enumerator:

```
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_VERSION
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_CAPABILITIES
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_ACTION_REPEAT_TRIGGER_INTERVAL
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_ACTION_REPEAT_WAIT_TIME
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_ACTION_BANKS_SUPPORTED_RX
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_ACTION_BANKS_SUPPORTED_TX
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_IRDB_VENDOR_SUPPORT
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_ACTION_BANKS_VERSION
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_ACTION_CODES_SUPPORTED_RX
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_ACTION_CODES_SUPPORTED_TX
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_MAPPABLE_ACTIONS
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_ACTION_MAPPINGS
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_HOME_AUTOMATION
EMBER_AF_RF4CE_ZRC_ATTRIBUTE_HOME_AUTOMATION_SUPPORTED
```

Definition at line 10 of file [rf4ce-zrc20-types.h](#).

### 8.328.3.2 enum EmberAfRf4ceZrcCapability

RF4CE ZRC capabilities.

Enumerator:

```
EMBER_AF_RF4CE_ZRC_CAPABILITY_SUPPORT_ACTIONS_ORIGINATOR
EMBER_AF_RF4CE_ZRC_CAPABILITY_SUPPORT_ACTIONS_RECIPIENT
EMBER_AF_RF4CE_ZRC_CAPABILITY_SUPPORT_HA_ACTIONS_ORIGINATOR
EMBER_AF_RF4CE_ZRC_CAPABILITY_SUPPORT_HA_ACTIONS_RECIPIENT
```

*EMBER\_AF\_RF4CE\_ZRC\_CAPABILITY\_SUPPORT\_ACTION\_MAPPING\_CLIENT  
 EMBER\_AF\_RF4CE\_ZRC\_CAPABILITY\_SUPPORT\_ACTION\_MAPPING\_SERVER  
 EMBER\_AF\_RF4CE\_ZRC\_CAPABILITY\_SUPPORT\_VENDOR\_SPECIFIC\_IRDB\_FORMATS*

*EMBER\_AF\_RF4CE\_ZRC\_CAPABILITY\_INFORM\_ABOUT\_SUPPORTED\_ACTIONS*

Definition at line 52 of file [rf4ce-zrc20-types.h](#).

#### 8.328.3.3 enum EmberAfRf4ceZrcCommandCode

RF4CE ZRC 2.0 command codes.

Enumerator:

*EMBER\_AF\_RF4CE\_ZRC\_COMMAND\_USER\_CONTROL\_PRESSED  
 EMBER\_AF\_RF4CE\_ZRC\_COMMAND\_USER\_CONTROL\_REPEATED  
 EMBER\_AF\_RF4CE\_ZRC\_COMMAND\_USER\_CONTROL\_RELEASED  
 EMBER\_AF\_RF4CE\_ZRC\_COMMAND\_COMMAND\_DISCOVERY\_REQUEST  
 EMBER\_AF\_RF4CE\_ZRC\_COMMAND\_COMMAND\_DISCOVERY\_RESPONSE  
 EMBER\_AF\_RF4CE\_ZRC\_COMMAND\_USER\_CONTROL\_PRESSED  
 EMBER\_AF\_RF4CE\_ZRC\_COMMAND\_USER\_CONTROL\_REPEATED  
 EMBER\_AF\_RF4CE\_ZRC\_COMMAND\_USER\_CONTROL\_RELEASED  
 EMBER\_AF\_RF4CE\_ZRC\_COMMAND\_COMMAND\_DISCOVERY\_REQUEST  
 EMBER\_AF\_RF4CE\_ZRC\_COMMAND\_COMMAND\_DISCOVERY\_RESPONSE  
 EMBER\_AF\_RF4CE\_ZRC\_COMMAND\_ACTIONS*

Definition at line 72 of file [rf4ce-zrc20-types.h](#).

#### 8.328.3.4 enum EmberAfRf4ceZrcActionType

RF4CE ZRC action banks.

Enumerator:

*EMBER\_AF\_RF4CE\_ZRC\_ACTION\_TYPE\_STOP  
 EMBER\_AF\_RF4CE\_ZRC\_ACTION\_TYPE\_START  
 EMBER\_AF\_RF4CE\_ZRC\_ACTION\_TYPE\_REPEAT  
 EMBER\_AF\_RF4CE\_ZRC\_ACTION\_TYPE\_ATOMIC*

Definition at line 90 of file [rf4ce-zrc20-types.h](#).

#### 8.328.3.5 enum EmberAfRf4ceZrcModifierBit

RF4CE ZRC modifier bits.

Enumerator:

*EMBER\_AF\_RF4CE\_ZRC\_MODIFIER\_BIT\_NONE*

*EMBER\_AF\_RF4CE\_ZRC\_MODIFIER\_BIT\_GUI  
 EMBER\_AF\_RF4CE\_ZRC\_MODIFIER\_BIT\_ALT  
 EMBER\_AF\_RF4CE\_ZRC\_MODIFIER\_BIT\_SHIFT  
 EMBER\_AF\_RF4CE\_ZRC\_MODIFIER\_BIT\_CTRL*

Definition at line 106 of file [rf4ce-zrc20-types.h](#).

### 8.328.3.6 enum EmberAfRf4ceZrcActionBank

RF4CE ZRC action banks.

Enumerator:

*EMBER\_AF\_RF4CE\_ZRC\_ACTION\_BANK\_HDMI\_CEC  
 EMBER\_AF\_RF4CE\_ZRC\_ACTION\_BANK\_HID\_KEYBOARD\_PAGE\_SECTION\_A

### 8.352.1 Macro Definition Documentation

#### 8.352.1.1 `#define EMBER_AF_PLUGIN_SLEEPY_MESSAGE_INVALID_ID`

Definition at line 21 of file `sleepy-message-queue.h`.

### 8.352.2 Typedef Documentation

#### 8.352.2.1 `typedef uint8_t EmberAfSleepyMessageId`

Definition at line 11 of file `sleepy-message-queue.h`.

### 8.352.3 Function Documentation

#### 8.352.3.1 `void emberAfPluginSleepyMessageQueueInitCallback ( void )`

Initialize the sleepy message queue.

#### 8.352.3.2 `uint8_t emberAfPluginSleepyMessageQueueGetNumUnusedEntries ( void )`

Returns the number of unused entries in the sleepy message queue.

#### 8.352.3.3 `EmberAfSleepyMessageId emberAfPluginSleepyMessageQueueStoreMessage ( EmberAfSleepyMessage * pmsg, uint32_t timeoutSec )`

Stores an `EmberAfSleepyMessage` to the sleepy message queue if an entry is available.

##### Parameters

|                         |                                                                                                                           |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <code>pmsg</code>       | Pointer to an <code>EmberAfSleepyMessage</code> structure containing information about the message that should be stored. |
| <code>timeoutSec</code> | The time in seconds that the message should be stored in the sleepy message queue.                                        |

##### Returns

The `EmberAfSleepyMessageId` assigned to the message if stored, or `EMBER_AF_PLUGING_SLEEPY_MESSAGE_INVALID_ID` if the message could not be stored to the queue. The message may not be stored if the queue is full, or the time duration exceeds the maximum duration.

#### 8.352.3.4 `uint32_t emMessageMSecRemaining ( EmberAfSleepyMessageId sleepyMsgId )`

Returns the number of milliseconds remaining until the sleepy message expires.

**Parameters**

|                    |                                                                          |
|--------------------|--------------------------------------------------------------------------|
| <i>sleepyMsgId</i> | The EmberAfSleepyMessageId of the message whose timeout should be found. |
|--------------------|--------------------------------------------------------------------------|

**Returns**

The number of milliseconds until the specified message expires, or 0xFFFFFFFF if a matching active message cannot be found.

### 8.352.3.5 EmberAfSleepyMessageId emberAfPluginSleepyMessageQueueGetPendingMessageId ( EmberEUI64 *dstEui64* )

Returns the next EmberAfSleepyMessageId value (that will expire next) for a given EmberEUI64.

**Parameters**

|                 |                                                                                 |
|-----------------|---------------------------------------------------------------------------------|
| <i>dstEui64</i> | The EmberEUI64 value of a device whose EmberAfSleepyMessageId is being queried. |
|-----------------|---------------------------------------------------------------------------------|

**Returns**

The EmberAfSleepyMessageId value of the next-expiring message for the specified EmberEUI64 if a match was found, or EMBER\_AF\_PLUGIN\_SLEEPY\_MESSAGE\_INVALID\_ID if a matching entry was not found.

### 8.352.3.6 bool emberAfPluginSleepyMessageQueueGetPendingMessage ( EmberAfSleepyMessageId *sleepyMsgId*, EmberAfSleepyMessage \* *pmsg* )

Searches the sleepy message queue for an entry with the specified EmberAfSleepyMessageId.

If a match was found, this copies the message into the [EmberAfSleepyMessage](#) structure pointer.

**Parameters**

|                    |                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>sleepyMsgId</i> | The EmberAfSleepyMessageId of the <a href="#">EmberAfSleepyMessage</a> structure that should be looked up in the sleepy message queue.                                                         |
| <i>pmsg</i>        | A pointer to an <a href="#">EmberAfSleepyMessage</a> structure. If a message is found in the sleepy message queue with a matching EmberAfSleepyMessageId, it will be copied to this structure. |

**Returns**

true if a matching message was found or false if a match was not found.

### 8.352.3.7 uint32\_t emberAfPluginSleepyMessageQueueGetNextMessageEventTimeoutMs ( void )

Returns the time in milliseconds until the next message in the sleepy message queue will timeout.

**Returns**

The remaining time in milliseconds until the next message will timeout.

### 8.352.3.8 uint8\_t emberAfPluginSleepyMessageQueueGetNumMessages ( EmberEUI64 dstEui64 )

Returns the number of messages in the sleepy message queue that are buffered for a given EmberEUI64.

#### Parameters

|                 |                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------|
| <i>dstEui64</i> | The destination EUI64 that should be used to count matching messages in the sleepy message queue. |
|-----------------|---------------------------------------------------------------------------------------------------|

#### Returns

The number of messages in the sleepy message queue that are being sent to the specified EmberEUI64.

### 8.352.3.9 bool emberAfPluginSleepyMessageQueueRemoveMessage ( EmberAfSleepyMessageId sleepyMsgId )

Removes the message from the sleepy message queue with the specified EmberAfSleepyMessageId.

#### Parameters

|                    |                                                                                  |
|--------------------|----------------------------------------------------------------------------------|
| <i>sleepyMsgId</i> | The EmberAfSleepyMessageId that should be removed from the sleepy message queue. |
|--------------------|----------------------------------------------------------------------------------|

#### Returns

true if a matching EmberAfSleepyMessageId was found and removed from the sleepy message queue, or false if not.

### 8.352.3.10 void emberAfPluginSleepyMessageQueueRemoveAllMessages ( EmberEUI64 dstEui64 )

Removes all messages from the sleepy message queue whose destination address matches the specified EmberEUI64.

#### Parameters

|                 |                                                                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------------------------------|
| <i>dstEui64</i> | The EmberEUI64 to search for in the sleepy message queue. All entries with a matching destination EUI64 should be removed. |
|-----------------|----------------------------------------------------------------------------------------------------------------------------|

### Functions

- `void emberAfPluginTemperatureMeasurementServerSetMeasurementRate (uint32_t measurementRateS)`

#### 8.364.1 Function Documentation

##### 8.364.1.1 `void emberAfPluginTemperatureMeasurementServerSetMeasurementRate ( uint32_t measurementRateS )`

Set the hardware read interval.

This function will set the amount of time to wait (in seconds) between polls of the temperature sensor. This function will never set the measurement interval to be greater than the plugin specified maximum measurement interval. If a value of 0 is given, the plugin specified maximum measurement interval will be used for the polling interval.

## 8.392.2 Function Documentation

### 8.392.2.1 void emAfPluginCommsHubFunctionTunnelInit ( uint8\_t *localEndpoint* )

Initialize internal data structures.

This function should be called from the plugin init callback.

#### Parameters

|                      |                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>localEndpoint</i> | The local endpoint from which all tunnels will be created. It is also the endpoint to which the GSME will request a tunnel. |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------|

### 8.392.2.2 bool emAfPluginCommsHubFunctionTunnelCreate ( EmberEUI64 *remoteDeviceId*, uint8\_t *remoteEndpoint* )

Create a tunnel to a device of type ESME, HCALCS or PPMID.

As defined in section 10.2.2.1 of the GBCS version 0.8 and copied below the CHF will call this function to request a tunnel be created with the specified destination.

"When a Communications Hub has successfully established a shared secret key using CBKE with a Device of type ESME, HCALCS or PPMID, the CHF shall send a RequestTunnel command to the Device to request a tunnel association with the Device.

Where an ESME, a HCALCS or a PPMID remains in the CHF Device Log, the CHF shall send a RequestTunnel command to the Device whenever:

- 0xFFFF seconds have elapsed since receipt of the most recent RequestTunnelResponse command from that Device; or
- the CHF receives a Remote Party Message addressed to the Device but does not have a functioning tunnel association with the Device; or
- the CHF powers on.

Where the CHF receives a RequestTunnelResponse command from a Device with a TunnelStatus of 0x01 (Busy), the CHF shall send another RequestTunnel command three minutes later.

Where the CHF receives a RequestTunnelResponse command from a Device with a TunnelStatus of 0x02 (No More Tunnel IDs), the CHF shall send a CloseTunnel command for any TunnelID that may relate to an active tunnel association with that Device and, after receiving responses to all such commands, send another RequestTunnel command."

#### Parameters

|                        |                                                            |
|------------------------|------------------------------------------------------------|
| <i>remoteDeviceId</i>  | The EUI64 of the device to which a tunnel is to be created |
| <i>remote-Endpoint</i> | The remote endpoint to which the tunnel is to be created   |

#### Returns

true if successful or false if an error occurred

**8.392.2.3 bool emAfPluginCommsHubFunctionTunnelSendData ( EmberEUI64 *remoteDeviceId*, uint16\_t *headerLen*, uint8\_t \* *header*, uint16\_t *dataLen*, uint8\_t \* *data* )**

Transfer data to a server through a tunnel.

This function can be used to transfer data to a server through a tunnel.

**Parameters**

|                       |                                                     |
|-----------------------|-----------------------------------------------------|
| <i>remoteDeviceId</i> | The EUI64 of the device to which data is to be sent |
| <i>headerLen</i>      | The length of any header that may prefix the data   |
| <i>header</i>         | Buffer containing the raw octets of the header.     |
| <i>dataLen</i>        | The length in octets of the data.                   |
| <i>data</i>           | Buffer containing the raw octets of the data.       |

**Returns**

true if successful or false if an error occurred

**8.392.2.4 bool emAfPluginCommsHubFunctionTunnelDestroy ( EmberEUI64 *remoteDeviceId* )**

Close a tunnel.

This function can be used to close a tunnel.

**Parameters**

|                       |                                                            |
|-----------------------|------------------------------------------------------------|
| <i>remoteDeviceId</i> | The EUI64 of the device to which the tunnel will be closed |
|-----------------------|------------------------------------------------------------|

**Returns**

true if successful or false if an error occurred

**8.392.2.5 void emAfPluginCommsHubFunctionTunnelCleanup ( EmberEUI64 *remoteDeviceId* )**

Cleanup a tunnel.

This function can be used to cleanup all state associated with a tunnel.

**Parameters**

|                       |                                                                        |
|-----------------------|------------------------------------------------------------------------|
| <i>remoteDeviceId</i> | The EUI64 of the device to which the tunnel state is to be cleaned up. |
|-----------------------|------------------------------------------------------------------------|

**8.392.2.6 void emAfPluginCommsHubFunctionTunnelClose ( EmberEUI64 *remoteDeviceId* )**

Close a tunnel.

This function can be used to close a tunnel on the commshub.

**Parameters**

|                       |                                                       |
|-----------------------|-------------------------------------------------------|
| <i>remoteDeviceId</i> | The EUI64 of the device whose tunnel is to be closed. |
|-----------------------|-------------------------------------------------------|

### 8.392.2.7 void emAfPluginCommsHubFunctionPrint ( void )

Print the tunnel table.

This function can be used to print the tunneling table of the commshub.

### 8.392.2.8 bool emAfPluginCommsHubFunctionTunnelExists ( EmberEUI64 *deviceEui64* )

### 8.394.1 Macro Definition Documentation

#### 8.394.1.1 `#define EMBER_AF_PLUGIN_TUNNELING_CLIENT_NULL_INDEX`

Definition at line 8 of file [tunneling-client.h](#).

### 8.394.2 Function Documentation

#### 8.394.2.1 `EmberAfPluginTunnelingClientStatus emberAfPluginTunnelingClientRequestTunnel (EmberNodeId server, uint8_t clientEndpoint, uint8_t serverEndpoint, uint8_t protocolId, uint16_t manufacturerCode, bool flowControlSupport )`

Request a Tunneling cluster tunnel with a server.

This function can be used to request a tunnel with a server. The Tunneling client plugin will look up the long address of the server (using discovery, if necessary), establish a link key with the server, and create an address table entry for the server before sending the request. All future communication using the tunnel will be sent using the address table entry. The plugin will call `emberAfPluginTunnelingClientTunnelOpenedCallback` with the status of the request.

#### Parameters

|                                 |                                                                                                                                                     |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>server</code>             | The network address of the server to which the request will be sent.                                                                                |
| <code>clientEndpoint</code>     | The local endpoint from which the request will be sent.                                                                                             |
| <code>serverEndpoint</code>     | The remote endpoint to which the request will be sent.                                                                                              |
| <code>protocolId</code>         | The protocol id of the requested tunnel.                                                                                                            |
| <code>manufacturerCode</code>   | The manufacturer code of the requested tunnel.                                                                                                      |
| <code>flowControlSupport</code> | true if flow control support is requested or false if not. Note: flow control is not currently supported by the Tunneling client or server plugins. |

#### Returns

`EMBER_AF_PLUGIN_TUNNELING_CLIENT_SUCCESS` if the request is in process or another `EmberAfPluginTunnelingClientStatus` otherwise.

#### 8.394.2.2 `EmberAfStatus emberAfPluginTunnelingClientTransferData ( uint8_t tunnelIndex, uint8_t * data, uint16_t dataLen )`

Transfer data to a server through a Tunneling cluster tunnel.

This function can be used to transfer data to a server through a tunnel. The Tunneling client plugin will send the data to the endpoint on the node that is managing the given tunnel.

#### Parameters

|                    |                                                         |
|--------------------|---------------------------------------------------------|
| <i>tunnelIndex</i> | The index of the tunnel through which to send the data. |
| <i>data</i>        | Buffer containing the raw octets of the data.           |
| <i>dataLen</i>     | The length in octets of the data.                       |

#### Returns

[EMBER\\_ZCL\\_STATUS\\_SUCCESS](#) if the data was sent, [EMBER\\_ZCL\\_STATUS\\_FAILURE](#) if an error occurred, or [EMBER\\_ZCL\\_STATUS\\_NOT\\_FOUND](#) if the tunnel does not exist.

### 8.394.2.3 EmberAfStatus emberAfPluginTunnelingClientCloseTunnel ( uint8\_t *tunnelIndex* )

Close a Tunneling cluster tunnel.

This function can be used to close a tunnel. The Tunneling client plugin will send the close command to the endpoint on the node that is managing the given tunnel.

#### Parameters

|                    |                                   |
|--------------------|-----------------------------------|
| <i>tunnelIndex</i> | The index of the tunnel to close. |
|--------------------|-----------------------------------|

#### Returns

[EMBER\\_ZCL\\_STATUS\\_SUCCESS](#) if the close request was sent, [EMBER\\_ZCL\\_STATUS\\_FAILURE](#) if an error occurred, or [EMBER\\_ZCL\\_STATUS\\_NOT\\_FOUND](#) if the tunnel does not exist.

### 8.394.2.4 void emberAfPluginTunnelingClientCleanup ( uint8\_t *tunnelIndex* )

Cleanup a Tunneling cluster tunnel.

This function can be used to cleanup all state associated with a tunnel. The Tunneling client plugin will not send the close command.

#### Parameters

|                    |                                     |
|--------------------|-------------------------------------|
| <i>tunnelIndex</i> | The index of the tunnel to cleanup. |
|--------------------|-------------------------------------|

### 8.394.2.5 void emAfPluginTunnelingClientPrint ( void )

## 8.396.2 Function Documentation

### 8.396.2.1 EmberAfStatus emberAfPluginTunnelingServerTransferData ( uint16\_t tunnelIndex, uint8\_t \* data, uint16\_t dataLen )

Transfer data to a client through a Tunneling cluster tunnel.

This function can be used to transfer data to a client through a tunnel. The Tunneling server plugin will send the data to the endpoint on the node that opened the given tunnel.

#### Parameters

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| <i>tunnelIndex</i> | The identifier of the tunnel through which to send the data. |
| <i>data</i>        | Buffer containing the raw octets of the data.                |
| <i>dataLen</i>     | The length in octets of the data.                            |

#### Returns

[EMBER\\_ZCL\\_STATUS\\_SUCCESS](#) if the data was sent, [EMBER\\_ZCL\\_STATUS\\_FAILURE](#) if an error occurred, or [EMBER\\_ZCL\\_STATUS\\_NOT\\_FOUND](#) if the tunnel does not exist.

### 8.396.2.2 void emberAfPluginTunnelingServerToggleBusyCommand ( void )

Toggle a "server busy" status for running as a test harness.

This function can be used to set the server in to a busy state, where it will respond to all request tunnel commands with a busy status. NOTE: existing tunnels will continue to operate as normal at this point in time.

### 8.396.2.3 void emberAfPluginTunnelingServerCleanup ( uint8\_t tunnelId )

Cleanup a Tunneling cluster tunnel.

This function can be used to cleanup all state associated with a tunnel. The Tunneling server plugin will not send the close notification command.

#### Parameters

|                 |                                          |
|-----------------|------------------------------------------|
| <i>tunnelId</i> | The identifier of the tunnel to cleanup. |

## 8.408.2 Function Documentation

### 8.408.2.1 EmberStatus `emberAfZllSetInitialSecurityState( void )`

Generate a random network key and initialize the security state of the device.

This function is a convenience wrapper for ::emberZllSetInitialSecurityState, which must be called before starting or joining a network. The plugin will initialize the security state for the initiator during touch linking. The target must initialize its own security state prior to forming a network either by using this function or by calling ::emberZllSetInitialSecurityState directly.

#### Returns

An [EmberStatus](#) value that indicates the success or failure of the command.

### 8.408.2.2 EmberStatus `emberAfZllInitiateTouchLink( void )`

Initiate the touch link procedure.

This function will cause the stack to broadcast a series of ScanRequest commands via inter-PAN messaging. The plugin will select the target that sent a ScanResponse command with the strongest RSSI and attempt to link with it. If touch linking completes successfully, the plugin will call [emberAfPluginZllCommissioningTouchLinkCompleteCallback](#) with information about the network and the target. If touch linking fails, the plugin will call [emberAfPluginZllCommissioningTouchLinkFailedCallback](#).

#### Returns

An [EmberStatus](#) value that indicates the success or failure of the command.

### 8.408.2.3 EmberStatus `emberAfZllDeviceInformationRequest( void )`

Initiates a touch link for the purpose of retrieving information about a target device.

As with a traditional touch link, this function will cause the stack to broadcast messages to discover a target device. When the target is selected (based on RSSI), the plugin will retrieve information about it by unicasting a series of DeviceInformationRequest commands via inter-PAN messaging. If the process completes successfully, the plugin will call [emberAfPluginZllCommissioningTouchLinkCompleteCallback](#) with information about the target. If touch linking fails, the plugin will call [emberAfPluginZllCommissioningTouchLinkFailedCallback](#).

#### Returns

An [EmberStatus](#) value that indicates the success or failure of the command.

### 8.408.2.4 EmberStatus `emberAfZllIdentifyRequest( void )`

Initiates a touch link for the purpose of causing a target device to identify itself.

As with a traditional touch link, this function will cause the stack to broadcast messages to discover a target device. When the target is selected (based on RSSI), the plugin will cause it to identify itself by unicasting an IdentifyRequest command via inter-PAN messaging. If the process completes successfully, the plugin will call [emberAfPluginZllCommissioningTouchLinkCompleteCallback](#) with information about the target. If touch linking fails, the plugin will call [emberAfPluginZllCommissioningTouchLinkFailedCallback](#).

**Returns**

An [EmberStatus](#) value that indicates the success or failure of the command.

**8.408.2.5 EmberStatus emberAfZllResetToFactoryNewRequest ( void )**

Initiates a touch link for the purpose of resetting a target device.

As with a traditional touch link, this function will cause the stack to broadcast messages to discover a target device. When the target is selected (based on RSSI), the plugin will reset it by unicasting a ResetTo-FactoryNewRequest command via inter-PAN messaging. If the process completes successfully, the plugin will call [emberAfPluginZllCommissioningTouchLinkCompleteCallback](#) with information about the target. If touch linking fails, the plugin will call [emberAfPluginZllCommissioningTouchLinkFailedCallback](#).

**Returns**

An [EmberStatus](#) value that indicates the success or failure of the command.

**8.408.2.6 void emberAfZllNoTouchlinkForNfn ( void )**

No touchlink for non-factory new device.

This function will cause the NFN device to refuse network start/join requests in case it receives them and will not allow touchlinking. This can be useful to restrict touchlink stealing.

**8.408.2.7 void emberAfZllAbortTouchLink ( void )**

Abort the touch link procedure.

This function can be called to cancel the touch link procedure. This can be useful, for example, if the touch link target is incorrect.

**8.408.2.8 bool emberAfZllTouchLinkInProgress ( void )**

Indicates if a touch link procedure is currently in progress.

**Returns**

true if a touch link is in progress or false otherwise.

**8.408.2.9 void emberAfZllResetToFactoryNew ( void )**

Reset the local device to a factory new state.

This function will cause the device to leave the network and clear its network parameters, reset its attributes to their default values, and clear the group and scene tables.

**8.408.2.10 EmberStatus emberAfZllScanForJoinableNetwork ( void )**

Scan for joinable networks.

This function will scan the primary channel set for joinable networks. If a joinable network is found, the plugin will attempt to join to it. If no joinable networks are found or if joining is not successful, the plugin will scan the secondary channel set for joinable networks. If a joinable network is found, the plugin will attempt to join to it. The plugin will only scan the secondary channel set if ::EMBER\_AF\_PLUGIN\_ZLL\_COMMISSIONING\_SCAN\_SECONDARY\_CHANNELS is defined. Otherwise, scanning stops after the initial scan of the primary channel set.

Routers and end devices should scan for joinable networks when directed by the application. Scanning for joinable networks enables classical ZigBee commissioning with non-ZLL devices.

#### Returns

An [EmberStatus](#) value that indicates the success or failure of the command.

#### **8.408.2.11 EmberStatus emAfZllScanForUnusedPanId( void )**

Scan for an unused PAN id.

This function will scan the primary channel set for a channel with low average energy and then select a PAN id that is not in use on that channel. The plugin will then form a ZLL network on that channel with the chosen PAN id.

Factory new routers should form a new ZLL network at startup. All routers should form a new ZLL network if classical ZigBee commissioning has failed. End devices should not use this API and should instead form ZLL networks via touch linking.

#### Returns

An [EmberStatus](#) value that indicates the success or failure of the command.

#### **8.408.2.12 EmberStatus emAfZllFormNetwork( uint8\_t channel, int8\_t power, EmberPanId panId )**

#### **8.408.2.13 void emAfZllStackStatus( EmberStatus status )**
